### EXTRACT

*From an Act prescribing Rules for the Government of the State Library,  
passed March 8th, 1861.*

Sec. 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

Sec. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General, and the Trustees of the Library.

# Mining and Scientific Press.

INV. 1898.

Single Copies, Fifteen Cents.

Terms: One Year, \$5; Six Months, \$3.

A Journal of Useful Arts, Science, and Mining and Mechanical Progress.

DEWEY & CO., PUBLISHERS  
And Patent Solicitors.

SAN FRANCISCO, SATURDAY, JULY 6, 1867.

VOLUME XV.  
Number 1.

TABLE OF CONTENTS.

Daboll's Fog Trumpet—Illustrated.  
The Keena River Country and its Mines—Continued.  
Facts About Patent Matters—Continued.  
Co-operative Labor.  
Business of the Patent Office.  
A New Scarecrow.  
An Open Field for Inventors.  
A Novel Gunboat.  
Removal of Fire-Damp from Mines.  
Iodine a Disinfectant.  
Lithium of Mahogany.  
California Academy of Natural Sciences.  
The Coming Wheat Crop.  
Pacific Railroad.  
Money Orders—List of Offices on the Pacific Coast.  
Pacific Chemical Works.  
Fire-Pump Trial.  
New Patents and Inventions.  
Notices to Correspondents.  
San Francisco Market Rates.  
San Francisco Weekly Stock Circular.  
Stock Prices—Bid and Asked.  
San Francisco Metal Market.

MECHANICAL MISCELLANY.—  
Steam vs. Hand Labor; Saw Feeds; American Iron Pumps and Sile-wheels; A New Fire-Damp; Artificial Wood; Steel Cooking Utensils; Plaster of Paris—Accidental Discovery; Case-Hardening Iron; Self-Propelling Steam Engine.  
SCIENTIFIC MISCELLANY.—  
Facts About Fuel; Vocal Machinery of Birds; Inflammability of Thoroughly Dried Wood; Results of Science: The Phenomena of Sound; Artificial Agate; To Print Letters by Sunlight; Atmospheric Action; Oxidation by means of Charcoal; Illuminating Gas; Vanadium.  
MINING MISCELLANY.—  
Embracing late intelligence from the various counties and districts in California, Arizona, Idaho, Montana, Nevada, Oregon and Colorado.  
Mining Shareholders' Directory.

Daboll's Fog Trumpet.

We give, herewith, a finely executed perspective view of one of Daboll's Fog Trumpets, the same as that which has recently been located near the entrance of the Golden Gate, by the foresight and munificence of the Pacific Mail Steamship Company. The object of this invention is to provide a machine to give notice of danger to vessels, when the weather is too thick for the ordinary lights to be seen. The particular machine here represented, has been sent to the Paris Exposition, where it is attracting much attention. A correspondent of a New York paper, in writing from Paris of its performance says: "It was sounded the other day, and when the Arabs, Japanese and Malays heard it, they fell upon their faces, thinking Allah had come in the shape of a roaring lion. It roused the Faubourgs like the bell of Murat. The whistle of the calliope is no more than a bird song to it." Quite a number of these trumpets are in operation in various places. There is one

This invention is considered superior to a bell for giving signals, for two reasons—it can be heard at a much greater distance, and the ear can very readily distinguish the direction from which the sound comes, which

pressing power that may be used, into a large reservoir, A. The sound given out is made sharp and somewhat ringing, by the use of reeds, while the air is admitted at regular intervals, through valves worked by studs upon the outer periphery of the wheel, C. By interchanging the number and position of the studs on this wheel, the trumpet may be made to give a certain series of sounds, which may convey definite information, like any ordinary sound telegraph.

Of course any power can be made to condense the air, and operate the rotating machinery, etc. The caloric engine, as herewith represented, is generally employed, for its simplicity, reliability and cheapness. This trumpet is the invention of C. L. Daboll, of New London, Conn., and was first described and illustrated in the *American Artisan*, of the 6th of March last.

The one which has been erected at the entrance of this harbor has been located on the bluff about a quarter of a mile from the Cliff House. We understand that it accomplishes all that was expected of it, and can be heard to the distance of about ten miles. It makes about one revolution a minute, and sounds three times with every revolution. One blast is directed towards the entrance of the harbor; one towards the Cliff House—down the coast, and one westward, directly out to sea. We are not aware that it is ever heard in the lower portion of the city; the reason of which is probably due to the fact that the blast is never given in this direction. As soon as a fog sets in, the fire is applied to the machinery and the trumpet is made to sound its warning signals.

Although it has been placed there at the expense of the P. M. S. S. Co., it is, nevertheless, sounded for all whenever there is used of it, whether one of the Company's steamers is expected or not. The purchase and maintenance of this guide to the entrance of the Golden Gate, has been a great expense to the Company; and we see no reason, now that its utility has been fully proven, why the Government should not relieve the Company of a work so necessary to the commerce of the city. In case the Government refuses to act in the premises, the merchants of this city should share in the expense of a mutual benefit.

FOR OUR CABINET.—We have upon our table several contributions for our cabinet, among which are several very valuable specimens from the Green Emigrant, which will be duly noticed next week.

DABOLL'S FOG TRUMPET.

A NEW VOLUME commences with the present issue, and we would again urge upon those who are not already on our list, that now is a favorable opportunity to subscribe. We alluded, last week, to the general scope and character of the MINING AND SCIENTIFIC PRESS, and would again call attention to our semi-annual index, as an evidence of the vast and varied amount of useful matter which is comprised, even within a single half-yearly volume. We lay the entire world under contribution for the supply of our columns, which is gathered in at great cost of labor and research. We endeavor to make our paper a telescope by which our readers, sitting in their quiet homes, can peer out into the world of science and art, and bring directly within their gaze and comprehension every important discovery, invention or other effort in the great march of progress, so that, without interruption to their daily avocations, they may, once a week, be advised of every advance step made in science and every improvement introduced into mechanics and manufacturing industry in any part of the world. They can also look out into our broad field of mining, and note, week by week, the progress made in the development of that great leading industry of the Pacific Coast. Each miner, as he is engaged in pushing forward the work of development in his particular claim, can also note the progress made in every other important mine upon the coast. How well we do this, let our columns speak for themselves. Suffice it for us to say, we shall in no wise relax our efforts in the future; but shall endeavor, with each successive volume, to introduce some new feature which shall add to the interest and value of the paper.

A SELF WINDING WATCH—ALMOST.—Josephi & Co., at 641 Washington street, are selling quite a novelty in the line of watches. This watch is wound up by simply opening to see the time of day. Every time the watch is opened, it is wound for six hours; as soon as it is wound fully up, the winding apparatus is thrown out of gear, so that no accident can come from a too frequent opening. When fully wound up, it will run ten days. The watch is the invention of Rubens, of Geneva, and was patented in this country in December last. Josephi & Co. are the sole agents for the watch in this State.

about six miles below Halifax, and they have been placed at each of the following places in this country: In San Francisco harbor, at Detroit, at New London, at New Haven, at Beaver Tail, Narraganset Bay. The English Government has placed one on the Isle of Wight, at Dungeress, and at Glasgow. A small one has also been placed on the deck of the Royal Mail steamship Cuba, of the Cunard line.

is impossible with the sound of a bell. Its less cost and greater simplicity, also makes it preferable to a steam whistle. When in operation, the trumpet is made to revolve on its axis, by means of bevel gears at E, F, the power being communicated through the wheel, B, and shaft attached, which are revolved by a worm shown on the driving shaft of the engine.

The trumpet is operated by condensed air—which is forced by the engine or other com,

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

(Written for the Mining and Scientific Press.)

## The Reese River Country and its Mines.

BY A. J. HOWE.

(Continued from Page 402.)

## PHILADELPHIA DISTRICT—CONTINUED.

There are a number of locations in this belt, which is of gray slate. They are known as the Transylvania, Nos. 1, 2 and 3, El Dorado, and Child & Canfield. The latter has produced a large quantity of astonishingly rich ore, and the company will soon erect one of the largest mills yet built in Nevada. On the Transylvania No. 2, the most thorough developments are progressing, and the machinery for a forty-stamp mill is ready to be freighted over the Sierra Nevada as soon as the roads will permit. There are other locations in this district claimed to be equally rich; and one thing seems to be certain—that is, when Belmont has the milling facilities demanded by the ore to be seen in the Transylvania belt, its shipments will be second to no other district in Nevada. Wood of excellent quality is sufficiently abundant in the immediate vicinity of the mines to last for several years, while the range, both north and south, has a bountiful supply for an almost indefinite time.

So little was this region known a few years ago that it was said no person could live to prospect it, owing to the scarcity of water and the hostility of the Indians. With the former, the entire section is quite as well supplied as other portions of Nevada. There are also extensive tracts of meadow land along the water courses and at their sinks; while the Indians are as quiet and harmless as any I have seen. Nearly all of them are disposed to work for such return in provisions, clothing or money as may be offered them. It is said that this valley below Belmont is the place where Judge Ralston perished in 1864. It might have been from hunger; but that it could have been from want of water is improbable, as the range on either side of Monitor Valley affords it in nearly all the cañons. It will be remembered that he was seen, in his delirious wandering, by friendly Indians, who offered him food, and a few days after his lifeless body was found by them.

The town of Belmont is growing up rapidly. A spirited paper, called the *Silver Bend Reporter*, has just made its appearance here. Business of all descriptions, mechanics and laborers, keep always in excess of the demand; but this will probably not be the case when the new mills are in progress. This place will surely be the great central mart of Southeastern Nevada; with its own mines of fabulous wealth and surrounded on every side by the most wonderful rich mining districts in the world, nothing can prevent it becoming such.

## DANVILLE RANGE

Lies on the east of Monitor Valley. Through this range a fine road is now being constructed, passing through Alatoony Pass, which is situated nearly east of Belmont, and is twelve miles distant to the entrance at Barley creek. North of the Pass, the mountains gradually rise, till they reach an elevation of 2,500 feet above the valley, and form extensive table lands, visible as a prominent feature from all the higher peaks of the ranges we have passed through from the west. On the north and northeast of this table land the mountains drop abruptly. Along the base of the bluff in the depression of the range at this point is situated

## DANVILLE DISTRICT,

Which was discovered in the summer of 1866. It lies about east of Northumberland, or in latitude 38° 50', and is on the northeastern slope of the range. The formation in which the lodes occur is principally of granite. Some of them are of great size, and will compare very well with the famous districts that surround it. Very little work has been done in the district, yet

Danville will tell its own story before the present summer has past. The Vanderbilt lode has been rated by some who have visited it as equal in promise to any of the famous mines of Hot creek, Northumberland or Silver Bend.

This range of mountains is well supplied with the usual stunted timber of Central Nevada. The Clipper Gap, or Stonebargers road, leading from Austin to Pahranagat, passes through this district, from whence it diverges southerly, through Fish Springs Valley, to the head of Hot Creek, where it unites with the road via Charnock's and Alatoony Passes. Nearly east of Danville, on the opposite side of the valley, we find

## MOREY DISTRICT.

This district was first discovered by Thos. Barnes and party in September, 1865. However, but little was done here until the following summer of 1866. The lodes occur in a narrow belt of granite and are not numerous, but are well defined, and give great promise of permanence when properly developed. Two or three of them are of unusually large size for veins occurring in a granite formation. The ore has a singular yellowish-gray appearance, indicating the presence of lead in the chloride state, at the surface, while it is not of a high grade or concentrated character, but uniformly diffused throughout the veins, rendering them equally valuable. Some of the lodes show large quantities of manganese, similar to that found at the surface in a number of the lodes of Lander Hill, at Austin. The belt to which the silver lodes are confined is in a lateral spur of the main range, but little elevated above the valley.

## UNDERGROUND LAKES.

In the valley between this and the Danville Range, there are a number of large circular springs of clear cold water, with no apparent outlets or inlets, all of which swarm with small fish, the great number of which lead one to suppose there must be more ample scope for them beneath the so-called valley. These fish springs, or, as they are sometimes called, wells, are not of unrequited occurrences in Central Nevada or in any part of the Great Basin of Utah. All of the rivers and creeks, both large and small, silently flow a portion of their length under ground. Why not lakes be hidden in the same manner? Near the head of the Humboldt Valley we have positive evidence of this. In one of the lateral valleys at the source of the Humboldt river there is a meadow, two miles long and half a mile wide. This, in season, is covered with the most luxuriant growth of grass that I have seen anywhere in the great Central Basin. On this there are several hundred wells, or rather air holes, circular in form, and from three to six feet in diameter. Clear crystal water rises in all nearly to the level surface of the meadow. Several of these I have sounded for bottom, which could not be found at forty feet. All these openings become black with small fish the instant a slight commotion is made in the water. A person, by bringing his weight heavily down, will shake the lake for many rods around, although it is sufficiently strong to bear up scores of cattle closely collected. I shall not soon forget the bath forced on me, several years ago, in rescuing an animal from one of these air holes, although I must confess that it was timely, in a sanitary or ahluent sense.

Now that we have established the existence of lakes under ground, what freak of nature or the elements caused it? Several hundred miles further east, near the head of Sweetwater river, in Utah, we find the possible solution. There is a valley of about the same extent as the one just described; on digging through the soil in any part of it two or three feet, we come to a bed of solid ice, as firm and clear as crystal, the depth of which has never been determined. The most natural conclusion to be arrived at is, that at an ancient date, this, which was once a lake, was frozen to a great depth, and by an unusually heavy storm of rain, the soil from the hills on either side was washed down upon it, and it has remained frozen for ages. Had this occurred in the milder climate of the lower valleys further west, the ice would have long since melted and left a soil-covered lakelet. The preponderance of vegetable matter supporting the soil is but a fibrous viry mat on its surface.

Returning to Alatoony Pass, we will take our course eastward. Soon after leaving the Pass, we reach Willow creek. Along its course, near the sink, there is considerable good farming land, which has been taken up for that purpose. At this point there is a short low range of hills in the center of what I have called (for want of a more appropriate name) Fish Springs Valley. However, I believe the valley lying east of the Hot Creek mountains was the one originally called by that name.

(To be continued.)

## Facts About Patent Matters.

## NUMBER FOUR.

## HOW TO OBTAIN A PATENT—THE PREPARATION OF THE CASE.

Of course, in letters like these, written for the general information of the public at large, it cannot be expected that the subject should be treated with that copiousness and precision that would characterize a professional work written for the use of lawyers and patent agents. All that will be attempted will be to state briefly, the general principles that govern the matter, so that every person can have a tolerably correct idea of the subject, and thus be able to determine for himself whether or not he has a patentable invention.

As soon as a person has completed an invention he should proceed to make his application for a patent. The first step is to make a model, which, if possible, should be a working model—that is, a perfect working machine—just such as the large one is intended to be for use. It must not occupy over one cubic foot of space, should be made of walnut or other hard wood or metal, neatly made and varnished, and there should be as little glue about it as possible, as it is otherwise apt to come apart after a time. If made of metal, brass or composition is preferable to iron or steel, on account of the liability of the latter to rust. As all the models, whether patented or rejected are kept in the office for public exhibition, where they are examined by people from all parts of Europe as well as our own country, every one will see the importance both in a personal and national sense, of making them neat and not clumsy.

The next step is to make duplicate drawings of it, one sheet being on *thick stiff drawing paper*, to be kept in the office at Washington for use in making examinations, and the others on vellum oil silk, or other thin strong material that will bear folding and transportation, and which is to be attached to the patent when issued to the inventor. The drawings should be on sheets 10 by 15 inches, and should generally be in perspective, with such detached plan and sectional views, as may be necessary to show fully and plainly all the parts and operations of the device whatever it may be. The drawings must be "artistically executed," and should be carefully shaded or colored. If different parts of the device are to be constructed of different material, as for instance the union of steel and other kinds of metal, then the parts should be so colored as to show the difference. So if one part is to be of wood, and another of metal or other material, the same rule should be observed. The preparation of the drawings is a matter of utmost importance, and should never be entrusted to any but a competent draughtsman. The importance of this will be understood when I state that the examinations at the patent office are conducted almost entirely by means of those thick drawings. Suppose, for instance, that a party makes an application for an important invention, some fixture of which is not clearly shown in his drawing. Although the examiner, by means of the specification and model can understand the case, that is not enough; either for the office, or the protection of the inventor. If it is a valuable thing, others will be endeavoring to pirate it, by making applications for devices containing that same feature; and then, especially if a new examiner has been appointed in charge of that class by a change in the administration or otherwise, the new examiner, having no knowledge of the original case, will look over the drawings, and not finding that feature there, will of course issue a patent for the same thing to the second applicant also? Even if there has been no change in the examiner, the same thing is likely to happen, because having several hundred and even thousands of cases to look over at each examination, it is utterly impossible for him to retain in his mind the particular features of each case. And thus, fault is often found with the patent office, when really the blame rests entirely upon the applicant, who, being too stingy to pay for proper drawings, is thus the cause of his own loss. To be sure the original applicant may, if he finds out that another party has a subsequent patent for his device, protect his rights by a resort to the courts; but in the first place he will not be likely to know anything about it for years, or until the other party has disposed of his interest to innocent parties; and even if he does he will find himself put to a heavy expense, all of which might have been prevented by the expenditure of two or three dollars more on his drawings in the first place. Again, if he be a poor man, and a wealthy company, or combination of parties are opposing him, they may keep the case in law by appeals and delays, until he is ruined, and the value of his patent de-

stroyed. Of course, the mere existence of such suits would prevent the purchase of rights by others from him, because men do not like to buy a lawsuit, nor pay their money for a thing that may prove of no value to them. And then, even if he succeeds in the end, in asserting his rights in the courts, his patent will have nearly or quite expired, and, as under the law of 1861, there can be no more extensions, he will find himself with money, time and invention all gone, and no help for it. And all this in consequence of not having a little drawing, which at most would not cost to exceed five or ten dollars, properly prepared.

The next step is to prepare the specification; and this is the most important part of all; no matter how perfect the model and drawing, if the specification is not complete the case will not be examined at the office. It will be returned until it is perfect, and the office even has the right to require that it shall be printed, if there is difficulty in making it plain otherwise. The most important requirement is, that it shall clearly and fully describe the invention, and how to construct and operate it. The description should be such that a mechanic or person skilled in the art to which it belongs, will be able to make one from the description. It is not necessary to describe those portions which form no part of the invention, except so far as may be necessary to explain the operation of the new parts. Yet every thing depends upon the description and claim. The latter is especially important, as upon the meaning, force and construction of the language employed, depends the whole value of the patent, if issued, as well as the question of its issue at all. To properly prepare a specification may seem a very simple and easy task, but such is not the case. It requires a knowledge of the arts, of science and scientific terms, and their proper use—of mechanics and the principles that govern their action—of law, and of the grammatical and legal force and construction of language, which is possessed by but very few persons. Lawyers seldom possess the mechanical knowledge, while mechanics still more generally lack the legal knowledge necessary to enable them to properly prepare a case for examination. It requires such a combination of legal and mechanical knowledge, together with a special knowledge of the principles and rules that govern the action of the office, that no person is really competent to undertake the business but those who have made it a study, or had experience at it. In the language of a recent writer on Patents and Patent Laws—"Mistakes of importance are not infrequently made by those who are trained to this work, and who make it their special business; but it can very seldom if ever be safe for any claimant to draw his own specification, unless he has large experience in work of this kind." The reason for this will readily appear when it is understood that the learned Judge Story denominated the patent branch of our jurisprudence as the "metaphysics of the law,"—having more subtle and nice distinctions than any other branch of law. In view of these facts, I unhesitatingly advise every person who has an invention worth patenting, to get some responsible and competent agent to attend to it for him.

No person scarcely would think of entering upon a suit at law, without employing a lawyer to attend to it, and make out his papers for him; and if a sensible man would not do that, much less would he attempt to prepare an application for a patent without knowing anything about the business. I am aware that persons frequently attempt it, but I am also aware that many lose their patent simply in consequence of not having their case properly prepared, or not knowing how to amend it so as to avoid the references given, when once rejected. Besides this, many times when they succeed in obtaining the patent, they find afterwards that it will not stand in law, or does not cover their invention, and is, therefore, useless. It is for this reason that many applicants are compelled to re-issue their patents at as great and often greater expense than the obtaining of the original. Hence, I repeat, every person having an invention worth patenting, should employ a competent and responsible agent—I say *competent and responsible*—for, unfortunately there are many who are neither competent or responsible, and, of them and their tricks, I shall have somewhat to say hereafter.—W. E. Dodge in *Prairie Farmer*

CO-OPERATIVE LABOR.—A curious circumstance has been cited in favor of co-operative labor, that when England was at war with Turkey, the merchant vessels of Greece, then a Turkish dependency, almost always escaped from their pursuers. The secret of their success was thought to be in the fact that on board of the Greek vessels, every man, from the captain to the cabin boy, had a pecuniary interest in the vessel and freight.

## Mechanical.

## Steam vs. Hand Labor.

When steam power first began to supersede hand labor in England, the forebodings of the workmen were terrible. So with the early introduction of labor-saving machines in general, both in England and on this continent. In England, the contest was a hard one. The laborers fought against such improvements with an ardor and perseverance which are exhibited only when men are fighting for a foothold upon existence. How short-sighted they were, and how baseless were their forebodings, has been abundantly proven by the sequel. The opening thereby made for educated and skilled labor has elevated the mechanic from the condition of a mere serf to that of the highest position in the social scale. The steam engine has proven the great civilizer of the age, and has completely broken down the wide distinction that once existed between the laborer and the tradesman or professional man. The genius of the skillful and intelligent mechanic has now no limit; while the avenues of wealth and fame are as open and promising to him as to that of any other member of society.

The time was when people believed that "all the intelligence," says the Boston *Investigator*, came from within the walls of a collegiate institution—that men, to be qualified to hold offices of trust and emolument, must first "graduate." But that idea has exploded. The efficient men of to-day are those who never had a "liberal" education; but those who have, are the most bigoted and illiberal among us, with a few honorable exceptions. The workshop produces the *free mind*, the potency of which is being everywhere felt, to the utter dismay of every grade of foggism.

By the aid of improved machinery, one man can now spin four hundred times more cotton yarn than the best cotton-spinner could in 1769, when Arkwright took out his first patent. In grinding grain and making flour, one man can now do one hundred and fifty times more work than he could a century ago. One woman can now manufacture as much lace in a day as a hundred women could a hundred years ago. It now requires as many days to refine sugar as it did months thirty years ago. Only forty minutes are now required to fix an amalgam of mercury and tin on a large looking-glass, which once occupied six weeks. The engines of a first-class iron-clad frigate perform as much work in twenty-four hours as 42,000 horses.

**SAW TEETH.**—The number of saw teeth should be proportioned both to hardness of the timber to be sawed and the power to be used. Each tooth of a saw can only cut advantageously a certain distance forward in passing through the log, which distance depends on the hardness of the wood; but if a saw has too many teeth, or is driven by too weak a power, each tooth will not cut so far forward as it should do, and there is a loss of power. If the power is great, and the number of teeth few, then each tooth will have to cut too far forward.

**AMERICAN IRON.**—Just previous to the breaking out of the war, an important experiment was made in Georgia to test the relative durability of American and English railroad iron. A portion of the track of the Central Railroad, subjected to great wear, was laid—one side with American and the other with English iron. At the expiration of two years, the wear was decidedly in favor of the American iron.

**PROPELLERS AND SIDE-WHEELS.**—All the American steamships sailing from New York to European ports have side-wheels; while all except four or five of the foreign ships have screw propellers. A new line of American steamers about to be started from Boston will have screw propellers.

**MECHANICAL CULTIVATION** of the land is attracting great attention in France.

**ARTIFICIAL WOOD.**—An important branch of industry has recently sprung up in Rhens Prussia. It consists in the manufacture of various articles from refuse wood and saw dust, which are agglomerated by a cement, the exact nature of which is not stated, and then pressed in molds, so as to form covers for photographic albums, small picture frames, rosettes, and other ornaments for the use of cabinet-makers, etc. For the last mentioned articles the composition is stained to imitate ebony, mahogany, walnut and other woods. The composition, or "serifarine," as it is called, may be sawn, cut, drilled, attached together by glue, and bent on hot plates. It may be polished with oil or French polish, and may be varnished and gilt. A similar composition was manufactured in France, a few years ago, by mixing fine saw dust with blood and submitting it to the action of a hydraulic press.—*London Builder*.

The above paragraph comes to us from Europe as something new, but we believe the very same branch of industry has been established in this country for several years. Saw dust has been combined with shellac, colored with various pigments, and pressed in molds, which were heated to the necessary degree to melt the shellac. The principal use made of this composition was the manufacture of ambrotype cases and small picture-frames, but an application of it was made in the form of huttons, chessmen, etc. It is a good imitation of vulcanized rubber, but it will not sustain the wear and rough usage which the rubber will bear.—*American Artisan*.

A NEW KIND OF FIRE-PROOF is described by the *Idaho World* as follows: While at Centreville, the other day, we were shown a novel kind of fire-proof above-ground cellar, belonging to and in the rear of the store of Duke & Co. The inner walls are of wood—ordinary plank. Against these upon the outside are the novel and perfectly fire-proof walls, made of mere dry earth mixed with molasses, with short cut fibers of old rope, to serve as hair in plastering, included in the mixture. When prepared, this strange plastering is spread on the boards, with a heavy plank to retain the mixture in the place intended, and then a big maul is hrought to play upon the plank to beat the mixture solidly in. This is the process, and it is repeated, layer upon layer, and width upon width, until the whole mass is two feet thick and entirely envelops the building. A roof of the same material, put on the same way, is added, and the building or cellar is completed. The cellar of Duke & Co. has been finished only a few days, and yet this covering of dry earth, molasses and hempen fiber is so hard that a nail cannot be driven into it, and it is impervious to either fire or water. It is an invention of Mr. J. B. Duke's, and though a good many laughed at him, and tried to convince him, while he was putting on the queer mixture, that it would be a signal failure, all now admit that his head was the soundest on that, and all agree that it is a model fire-proof cellar he has made.

**STEEL COOKING UTENSILS.**—Bessemer's steel is recommended for cooking utensils. The material is not acted on by the various agents which attack copper, and thus on the score of health and safety it possesses special recommendations. Over cast iron for saucepans, etc., it will have the further advantage that, as the vessels are so much thinner, a great saving of heating material will be effected. The rolled sheets of steel may, by the aid of a lathe, be pressed into any required form, and thus the vessel is constructed of one piece, requiring no rivets or soldering. Various household utensils have already been made of this steel.

**PLASTER OF PARIS—ACCIDENTAL DISCOVERY.**—The discovery that plaster of paris was a non-conductor of heat was made by a man who, while making plaster images, frequently washed his hands in a tin pan, the bottom of which soon became incrustated. Soon after, when it was put on the fire to heat water, it was found that the water could not be heated. This discovery was put to a practical use in the making of iron safes, the chambers of which are filled with plaster, which, in case of fire, prevents the contents from being burned.

**CASE-HARDENING IRON.**—Cast iron may be case-hardened by being rolled at a red heat in equal parts of powdered prussiate of potash, saltpetre and sal-ammoniac, and by being then placed, whilst yet hot, in a bath containing two ounces of prussiate of potash and four ounces of sal-ammoniac in every gallon of cold water.

A SELF-PROPELLING steam fire engine has been completed in Manchester, N. H., and made a successful trip through the streets.

## Scientific Miscellany.

**FACTS WITH REGARD TO FUEL.**—Wood is the most healthy fuel to burn, from the fact that it gives off the least noxious gas, and contains the largest amount of oxygen. Coal contains but very little or no oxygen; hence the oxygen necessary for its consumption must be extracted from the atmosphere. So with coal oil, which is a very unhealthy fuel, except when burned in well ventilated rooms. If either coal or oil is burned in a close room, the air will soon become "oppressive"—it will have been deprived of a large percentage of its oxygen. A coal fire will soon go out unless it has a large supply of air (oxygen), while wood will burn with comparatively little air, having a large supply of oxygen within itself. Hard, close-grained wood is converted into "live" coals; soft, porous wood into ashes.

Close-grained, heavy woods, like hickory and oak, give out the most heat; although the lighter woods, such as pine and willow, being open-grained, heat up much the quickest.

The relative value of the different fuels is determined by the amount of water which a pound thereof will raise to a given temperature. Thus, one pound of dry wood will convert forty pounds of ice into boiling water; while a pound of good coal will raise eighty pounds of ice to the boiling point of water—hence, one pound of coal is worth two pounds of dry wood. A ton of coal at ten dollars is equal to two cords of wood at five dollars per cord. It would be more equitable to sell wood by the ton, when dry, the same as coal. Such, indeed, is the custom in some portions of Europe.

**VOCAL MACHINERY OF BIRDS.**—Until recently, it was quite difficult to account for so small a creature as a bird, especially a canary bird, making a tone as loud as some animals a thousand times the weight of that bird. Recent discoveries, however, have shown that in birds the lungs have several openings communicating with corresponding air-bags or cells, which fill the whole cavity of the body from the neck downwards, and into which the air passes and repasses in the progress of breathing. This is not all; the very bones are hollow, from which air-pipes are conveyed to the most solid parts of the body, even into the quills and body. By forcing the air out of the body, they can dart to the greatest height with astonishing velocity. No doubt the same machinery forms the basis of their vocal powers, and at once solves the mystery.

**INFLAMMABILITY OF THOROUGHLY DRIED WOOD.**—Scientific writers inform us that wood, when continually exposed to a very moderate heat, such as that of steam and hot water pipes, will, in a space of time varying from eight to ten years, become so inflammable that it will take fire at a temperature very little over that of boiling water. The wood undergoes a slow process of charring, and, it is said, only awaits the admission of air (which it gets by shrinking and cracking) to burst out into flame.

**THE RESULTS OF SCIENCE.**—Agassiz was once presented with a single scale of an unknown fish. From the study of that scale he made a drawing of the appearance which the fish to which that scale belonged must have made. A fish, corresponding almost precisely with his drawing, and having identically the same scale, was subsequently found, thereby proving the correctness of the deductions of science.

The phenomena of sound gives the key to the modern theory of the propagation of light; both being produced by vibration—of sound in the air and of light in a much more subtle substance penetrating the universe. The musical scale corresponds to the scale of prismatic colors. In light there are different octaves, such as the caloric, the luminous, the chemical, etc.

**ARTIFICIAL AGATE.**—Agate when polished is sometimes seen to bear markings which have a curious resemblance to a variety of natural objects, such as trees, bushes, and occasionally animals. These natural appearances, it seems, may be easily imitated artificially in various shades of color on common chalcedony. It is only necessary to draw the design on the polished stone, using a common goose quill, with a tolerably strong solution of nitrate of silver, and then drying it in direct sunlight. The drawing will at first be of a brownish color, but if dried and touched over two or three times it will be reddish. The same solution of nitrate of silver mixed with 12½ per cent. of soot and 12½ per cent. of bitartrate of potash will give a greyish-brown color. A violet color may be obtained by mixing one part of alum with three parts of the silver solution. Gold dissolved in *aqua regia*, or a solution of chloride of gold, gives a light-brown color. White and opaque appearances will be given by a solution of nitrate of bismuth. All these colors are unaffected by the atmosphere, and will bear washing. They can, in fact, only be destroyed by a very high temperature. They may be discharged by treatment with strong acids, but will reappear after washing and a fresh exposure to sunlight.—*Mechanics' Magazine*.

**ATMOSPHERIC ACTION.**—The carbonic acid of the air slowly attacks the rocks above the ocean level, and thus turns them to clay, forming carbonates with the soda, potash, lime and magnesia, set free, and carries these down as carbonates to the sea, where the carbonate of soda decomposes the chloride of calcium of its waters, and forms common salt and carbonate of lime. This series of actions is the source of the salt of the sea, of all clays and of limestones which are chemical and not organic in their origin. Organic living things do not generate the carbonate of lime, but appropriate it, when found for them by chemical reactions; and thus great portions of our limestone rocks are made up of fossil remains. In forty-four feet of limestone, there is separated and condensed from the air a large atmosphere of carbonic acid gas; the early atmosphere was therefore very dense and unfit for the sustenance of the higher forms of life, until by far the greater portion of this gas has been removed by the formation of the carbonate of lime and vegetable matter now constituting coal and petroleum.

**TO PRINT LETTERS BY SUNLIGHT.**—Dissolve chalk in aquafortis to the consistence of milk, and add to that a strong solution of silver. Keep this liquor in a glass decanter well stopped, then cut out from a paper the letters you would have appear, and paste the paper on the decanter, which you are to place in such a manner that its rays may pass through the places cut out of the paper and fall on the surface of the liquor. The part of the glass through which the rays pass will turn black, while that under the paper will remain white. You must observe not to move the bottle during the time of the operation.—*Chemical News*.

**OXIDATION BY MEANS OF CHARCOAL.**—A communication was lately read at the London Chemical Society concerning experiments made with recently-burned boxwood charcoal. It was first placed in pure oxygen gas, and, after being saturated into other gases and vapors, and the absorption as well as the resulting vapors were noted. Moist sulphurous acid and sulphureted hydrogen were changed to sulphuric acid; common alcohol to acetic acid, amylic alcohol to valerianic acid; but the author asserted that ammonia does not undergo oxidation in the pores of charcoal.

**ILLUMINATING GAS** is said to be considerably increased in power by heating it and burning it with heated air. It would not be difficult or expensive to put up gas and air pipes, or a double pipe for both, in connection with household furnaces, etc., and apply combination burners.

**ELEMENTARY COMBINATIONS.**—The most delicious fruits are composed of hydrogen, oxygen, carbon and nitrogen; and the most deadly poisons are composed of the same ingredients, differing only in the proportions of their combination.

**A SIMPLE RULE.**—To ascertain the length of the day or night, at any time of the year, double the time of the sun's rising, which gives you the length of the night, and double the time of its setting, which gives the length of the day.

**VANADIUM.**—Mr. Musset has expressed the opinion that a minute quantity of the metal vanadium mixed with iron forms a valuable alloy, and gives a fine, tough, fibrous texture to bar iron.

California Academy of Natural Sciences.

REGULAR MEETING.

MONDAY EVENING, July 1, 1867.

Vice President Ransom in the Chair. Twenty members present.

W. A. S. Nicholson, A. B. Stout, M.D., and C. W. McCormick, M.D., were proposed for Resident Membership.

Donations to Cabinet.—Native oysters—Ostrea laticaudata; also, specimens of Purpura lactuca, by Dr. Cooper, who remarked that the former species was from the bay near the city, and were quite abundant and of good quality, and that the Purpura lived upon them. Specimens of the cones of Pinus contorta, commonly known as the false Norway pine, or twisted pine; also, Garryay Elliptica, or tassel tree, from Port Trinidad, presented by Dr. Veatch. Eggs, caterpillar, female and cocoon, of the California silkworm (Saturnia Californica, or Euryalus of Boisduval), presented by Dr. Lansweert, who remarked that the number of eggs of this silkworm is from 200 to 250. The female lays, on an average, from seventy to eighty per day. Three thousand eggs weigh an ounce. The caterpillar, direct from the egg, is more lively than that of the Chinese silkworm, and hardly keeps in its place. The silk produced by this worm is stronger than that of the Chinese, and is indigenous to California. Living on the Cecanobolus, it is well worth the attention of our silk-growers, as perhaps in feeding it on the mulberry a finer quality of silk would be obtained. The eggs were obtained from a female caught in the garden of the Philadelphia Brewery, Second street, in this city, on the 10th of June. The eggs were hatched on the 30th of the same month. The caterpillar requires generally from two to two and a half months before making its cocoon.

Dr. Kellogg made some remarks upon a specimen of Aristolochia Californica, a vine sometimes called Dutchman's pipe, from Angel Island, presented by Mr. E. Brooks. Mr. Stearns read a note from Prof. W. P. Blake, stating "that the fossil vertebræ from the Tulare Valley, which at a former meeting I suggested were Saurian, prove, on investigation, to be one of the larger forms of Delphinidae."

Mr. Stearns exhibited specimens of Haliotis from Monterey, which he had received from Dr. Canfield, of that place. The peculiarity of the specimens consisted in their being hybrids—a cross between the two species known to conchologists as H. Cracherodii and H. rufescens. In this connection, Mr. S. made the following general remarks upon the Haliotidae: "The word Haliotis means sea ear, from Halios, marine, and otis, ear. It is the abalone of the Native Californians, the ornier of the French, the lapa burra of the Portuguese, the orechiate of the Italians, the patella reale of the Sicilians. The shape of the shell may be compared to a Turbo, or top shell, with small apex whorls and a disproportionately large body whorl, and the whole flattened out. As regards shape, it holds the same position to Turbo that Concholepas does to Purpura. It adheres to the rocks like the Patellas and Fissurellas. To the latter genus it is somewhat allied through its anatomy. The arrangement of the teeth upon the lingual ribbon is like that of Fissurella. Cuvier found every individual that he examined had an ovary, and therefore concluded that the Haliotides were hermaphrodites. The chief peculiarity of these animals is, that their shells are perforated with a regular series of holes for the passage of the water to the respiratory organs, analogous to the vertical hole in the shell of Fissurella. The shells of this latter genus have but one hole, and are not pearly. The holes in Haliotis are ranged parallel, with the columellar lip, and being required only in that part of the shell which covers the branchial cavity, those nearest the spire are filled up and new ones formed as the animal advances in growth. The Haliotides are, in a certain degree, fixed or sedentary in their habits; and, though capable of locomotion, they probably move but little and quite slowly, since their structure, as seen in their powerful muscular foot, or disk, shows it is made for adhesion. "The brilliant and highly-colored interior of these shells, producing sometimes an iridescent effect, has been attributed by Sir David Brewster, Dr. Carpenter, and others, to minute striæ, or grooves, on the surface of the naecæ, which alternate with others of animal membrane. The color is produced by the nature of the lamina, which decompose the light in consequence of the interference caused by the reflection from two sides of each film, as may be seen in soap-bubbles. The naecæous lamina, when magnified, indicate a minute cellular structure. The cells are of a long

oval form, and their short diameter is not above 1-5000 of an inch." (Jeffrey.)

Dr. Cooper followed Mr. Stearns, and remarked upon the geographical distribution of this genus of mollusca.

A paper was read by Dr. W. P. Gibbons, of Alameda, in which he resumed the subject of the extinct forest of redwood on the Coast Range, near San Antonio. He directed attention to the fact that some of those stumps indicated a method of growth different from ordinary forest trees. Their immense size was due, in some cases, to the fact that three or four trees, growing in proximity, would ultimately impinge on each other, and if supplied with sufficient nourishment, they would grow together and form one immense trunk. This theory was verified by the statements of Dr. Kellogg and Mr. Bolander, who mentioned the fact that near Searsville several redwood trunks had grown together, and for forty feet formed a solid tree. There is no dependence in estimating the age of such trees in any other way than by carefully counting the number of concentric growths from a center. The oldest of these redwoods is about 1,500 years of age. The gigantea of Calaveras is about the same age. These redwoods are evidently the second generation of the race; hence we may infer that 3,000 years, at least, have passed by since the present growth first commenced on the Coast Range. But long before this must vegetation have covered portions of these hills, as the Sequoia reposes in a bed of alluvium twenty or thirty feet in depth. He also referred to the bulbous expansion of these trees near the base. These are composed of large expanding roots, growing together, and forming a complete network. The height of this indicates the degree of denudation which the soil has undergone during the lifetime of the tree. This is about five feet in 1,500 years. Some of these trunks have from 10,000 to 14,000 buds, partially developed, around their base, each bud having the power, under favorable conditions, of being developed and forming a perfect tree. The mass of wood contained in a tree twenty-five feet in diameter is equal to 4,000 cubic feet, weighing over 2,500,000 pounds.

Remarks were made in connection with the above by Messrs. Cooper, Kellogg, Veatch and Stearns. Adjourned.

REAL ESTATE SALE.—We would call the attention of the public to the advertisement which appears to-day of the sale of the Beideman Estate, comprising some of the finest building lots in the city. Having been for many years in the possession of J. C. Beideman, deceased, the title is represented by Mr. Jno. W. Brumagim, the Administrator, as unquestionable. Many fine residences have already been erected contiguous to this property. This will be one of the largest and at the same time one of the most advantageous sales of real estate that has taken place here for many years. It will be seen that the terms are exceedingly liberal—only ten per cent. of the purchase money to be paid at the time of sale, and fifteen per cent. more on confirmation by the Probate Court; thereafter, one-fourth annually until the whole is paid—the deferred payments bearing eight per cent. interest and secured by mortgage on the property, thus giving purchasers ample opportunity to make provisions for the payments, and, in fact, to earn the money before it is required. The sale commences on Wednesday, July 24th, at the salesroom of Maurice Dore & Co., 327 Montgomery street, and will continue until the whole is sold. Catalogues, with full description of property, can be had on application to the auctioneers, or to H. F. Williams & Co., Clay street.

THE REJECTED DRILL.—A correspondent writes us, too late for insertion this week, a statement that the "spring drill" alluded to recently in this paper, as having been condemned by Mr. Stanton, Superintendent of the summit tunnel on the Central Pacific Railroad, is the noted invention which has for years been successfully applied in the Mount Cenis tunnel in Europe. It is operated by compressed air.

American and Foreign Patents.—Letters Patent for Inventions can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and can furnish a full and complete list of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

65,094.—GANG PLOW.—L. B. Lathrop, San José, Cal.:

I claim, 1st, the rotary cutters, d, attached to the wheels, C, and forming flanges thereon, for the purpose of acting as land-sides for the plows, substantially as set forth.

2d, The axle, B, when arranged obliquely below the tongue, A, and when adjustable, by means of the screw-bolt, a, and slotted arm, b, substantially as and for the purpose herein shown and described.

3d, The devices for raising and lowering the plows, consisting of the screw, K, rods, i and h, and of the axle, B, lugs, f and g, bar, F, and bolts, c, respectively as set forth.

4th, The double tongue, A, M, in combination with the wheel, I, supporting the end of the main tongue, and with the hinges, l, m, n, and o, p, L, substantially as herein shown and described.

5th, The plow-beams, E, when bent so as to form off-sets at the top of the mold-boards, substantially as and for the purpose herein shown and described.

65,165.—PENCIL-SHARPENER.—Hubert Burgess, San Francisco, Cal.:

I claim the case or box, A, tray, B, and file, C, for sharpening pencils, substantially as shown and described.

RECENT INVENTIONS.

A WATER FLAME.—An ingenious person at Hartford, Conn., has invented a contrivance to burn water; and it is said that the flame is of wonderful intensity, and can be produced in three minutes, governed by a thumb screw, and can be applied to any purpose, as easily as any fire.

A NEW METHOD OF PROPULSION.—A citizen of Troy, N. Y., has invented a new method of applying propelling power, and has built a model of a vessel for experimenting. His device is to propel by four screws instead of one, all of which are to be placed directly under the vessel. The idea is that the location of the screws under the vessel will give it much greater speed, as at that point the screws operate upon solid water alone, and consequently gain additional power and efficiency.

TO PREVENT SUN-STROKE OF HORSES.—A gentleman in New York, has invented something for horses, for which he ought to be made an honorary member of the Society for the Prevention of Cruelty to Animals. It consists of a small reservoir, filled with water, placed on the animal's head, keeping the brain cool, and thus warding off the effects of heat and sun-stroke.

A CRAVAT PIN is among the attractive curiosities of the French department of the Paris Exposition. Everybody has seen bow bells are rung in all the new hotels. Instead of pulling the bell and making it ring by an exertion of mechanical force, we press a small button in the wall; this is connected by an electric wire with a small alarm, the clapper of which keeps on jingling so long as the button is pressed. Lift the hand from the button and the alarm ceases. This principle a French jeweler has applied to cravat pins. The knob of the pin is of various devices. It is a bare with a tabor, or drummer with his drum, or a death's head with a loose under-jaw, or a dog. Whoever chooses to wear such a pin has connected with it by a wire a small electrical battery in one of his pockets. He puts his hand into his pocket, touches a button there, and off goes the pin. The hare begins to patter on the tabor, the drummer to beat on his drum, the death's head to chatter and roll its horrid eyes, or the dog to bark and snap. When the hand is lifted from the button, instantly all is quiet.

SHEEP-SHEARING BY WIND.—A sheep-shearing machine, which operates just like a reaper or mower, and mows a swath of wool an inch and a half wide, has just been invented. The motion is obtained by means of a little wind-engine in the handle, which is driven by a force-pump or bellows forcing wind into it through a flexible tube. The days of hard work sheep-shearing are numbered.

A PAPER WATER bucket has been invented by Mr. J. W. Jarboe, of the American Paper Manufacturing Company, of Greenpoint, N. Y. Among its advantages over others is the fact that it is stouter, will not shrink or decay, and will outwear a dozen wooden buckets. It was recommended as adapted for use on board of vessels and steamships.

All About Sending Money by Mail.

RATES OF COMMISSION.—The following are the rates charged (in currency) for transmitting money to any part of the United States:

On Orders not exceeding \$20.....10 cents. Over \$20 and not exceeding \$50.....25 cents. No fractions of cents to be introduced in an Order. United States Treasury Notes, or National Bank Notes only received or paid.

To send over \$50, additional Orders must be obtained. Post Offices where Money Orders may be obtained will furnish blanks as follows, which the applicants will fill out: No. .... Amount .... Date, ...., 186 .

MONEY ORDER. Required for the sum of \$.... Payable at ....., State of ....., Payable to ....., Residing at ....., State of .....

ENTERED IN REGISTER: ....., Postmaster.

The applicant must, in all cases, write his own given name and surname in full, and when the given name of the payee is known, it should be so stated; otherwise initials may be used. The given names of married women must be stated, and not those of their husbands. For example: Mrs. Mary Brown must not be described as Mrs. William Brown.

Names of parties and places, and the sums, to be written in the plainest possible manner.

As there are several places of the same name in the United States, applicants must be careful to indicate which of them they mean; and the Postmaster will satisfy himself, before writing out the order, that the place indicated is the one intended.

List of Money-Order Post Offices in the Pacific States and Territories, May 20, 1867.

Table listing California post offices: Auburn, Benicia, Camptsville, Chico, Colusa, Colusa, Downville, Dutch Flat, Eureka, Folsom, Forest Hill, Georgetown, Gilsboville, Gilroy, Grass Valley, Headburg, Hone Valley, Jackson, Los Angeles, Los Angeles, Mariposa, Marysville, Martine, Mokelumne Hill, Monterey, Napa, Nevada City, Oakland, Oroville, Petaluma, Placerville, Red Bluff, Sacramento, San Rafael, San Francisco, Santa Cruz, Santa Rosa, Suisun, Sta. Clara, Suisun, Tuolumne, Ukiah, Yuba, Yuba, Yuba.

Table listing Nevada post offices: Virginia City, Carson, Carson.

Table listing Oregon post offices: Albany, Canyon City, Cal. Falls, Dallas, Eugene City, Hillsdale, Lafayette, La Grande, Oregon City, Portland, Roseburg, Salem, The Dalles, Umatilla.

Table listing Idaho Territory post offices: Boise City, Idaho City.

Table listing Montana Territory post offices: Helena.

Table listing Washington Territory post offices: Olympia, Steilacoom City.

A PIONEER HARDWARE AND AGRICULTURAL STORE.—The extensive store of Messrs. Webster Brothers, of Stockton, was established in 1850, and, we believe, now stands in favorable comparison with any like establishment on this coast. Through the intelligence and energy of its proprietors, much has been accomplished for the development and advancement of the agricultural resources of an important portion of our young State. Experience has made them familiar with the wants of their various customers, and secured to them a great measure of success.

The introduction of improved agricultural implements is producing wonderful results in California, and yet the work has but fairly commenced. Steam plows and steam threshers are yet to become common in our great grain fields.

Messrs. Webster Brothers are now introducing many well tried and thoroughly effective machines and farming implements, prominent among which we may name the "Baxter California Gang Plows," which we are assured are really a series of new gang plows adapted to different soils throughout the coast. As soon as the electrotype plate of this famous plow is received, it will be displayed to the readers of the PRESS.

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, July 6, 1867.

CITY STOCKS.

The demand for city stocks continues light; in fact, for a month past, public transactions in this class of securities have been very small.

The semi-annual dividend period of our local savings banks and other institutions is at hand, and the following have already announced the per centage of net earnings they will disburse to their depositors and stockholders: Odd Fellows' Savings Bank, 10-15 per cent. per annum on term deposits, and 8 1/2 per cent. on ordinary deposits.

We refer our readers to the annexed interesting table of mining stock dividends:

Table with columns for Company, Dividend, and Date. Includes companies like Adella, Belcher, and Crown Point.

between the 700 and 780 feet level, an entirely new body of ore, from three to three and a half feet in width, has been found, which is said to be of a very fine quality.

At the close of June, the shaft had attained a depth of 500 feet. Crown Point—has fluctuated very materially during the past week, opening at \$2,200, falling to \$1,800, again advancing to \$2,200, receding rapidly to \$1,760, and closing yesterday at \$1,550.

YELLOW JACKET—declined from \$1,660 to \$1,480, improved to \$1,655, receded to \$1,575, and closed at \$1,650, buyer 30.

A dividend of \$75 per share will be paid on the 10th inst.

GOULD & CURRY—is in better favor, having advanced from \$630 to \$800 per foot, and closed at \$710, buyer 30. The north-east drift from the fourth station is reported to run in a mixture of clay and porphyry, containing a few small seams of barren quartz.

KENTUCK—rose from \$445 to \$550, and closed at \$510, a 60. The bullion returns in June amounted to \$130,255.51. After paying all expenses, etc., this company have a balance of \$117,344.37 on hand at the close of June.

CHOLLAR-POTOSI—sold to a considerable extent, improving from \$445 to \$460, declining to \$430, rising to \$487.50, and closing at \$470. It is reported that good ore has been found in the north end of the Blue Wing stope; otherwise the mine presents no new features, except that they are now sinking from the Peck drift to make the connection with the second station.

OPHR—A large number of shares have changed hands during the week, improving from \$320 to \$387.50, but fell off to \$320, closing at \$325. The cause of the delay in obtaining ore has been the necessity for effecting ventilation between the ninth and tenth levels, which was accomplished on Sunday last; since then they have been taking out ore. The vein is from 3 to 4 feet wide as now developed.

BELCHER—opened at \$460, receded to \$420, advanced to \$430, declined to \$405, and closed yesterday at \$400.

OVERMAN—has been somewhat less active, improving from \$225 to \$240, declining to \$200, rallying to \$227.50, and closing at \$212.50. The conflict of authority in the management of the mine has unsettled the price of the stock.

IMPERIAL—advanced from \$220 to \$237.50, receded to \$215 buyer 30, and closed at \$210. The receipts of bullion in June aggregated over \$107,000.

CONFIDENCE—sold at \$64. The bullion product for June amounted to \$14,000. GOLD HILL Q. M. & M. Co. sold at \$194@210. Bullion value in June, \$12,500.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,656,206.

A Paying Newspaper for Sale.

A one-half interest in one of the best Country Papers in the State, is offered for sale on desirable terms. The journal is the oldest in the county, is situated at the County Seat, and surrounded by one of the most prosperous and promising Quartz and Gravel Mining Districts in the State.

MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.)

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Dividend Sale; and Amount and Time of Payment of Dividends.

Table listing mining companies, locations, and dividend details. Includes Adella, Belcher, Crown Point, etc.

\*Those marked with an asterisk (\*) are advertised in this journal.

Latest Stock Prices Bid and Asked.

Table of stock prices for various companies and bonds, including United States Bonds, San Francisco City Bonds, etc.

MINING STOCKS—WASHOE DISTRICT.

Table listing mining stocks in the Washoe District, including Alpha, Belcher, Bullion, etc.

San Francisco Market Rates.

Table of market rates for various commodities like flour, sugar, and coffee.

Table of retail prices for various goods like butter, cheese, and fruit.

San Francisco Metal Market.

Table of metal market prices for items like iron, steel, and copper.

Jacob Snew, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street) takes all kinds of Photographs in the best style of the Art.

Parsons desirous of obtaining the finest Wood Engravings, can procure them only by having the picture photographed on the block, by D. H. WOODS, No. 28 Third street.

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary.

Gold Bars, of whatever size, if well cast, assayed for two dollars, at A. P. MOLLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint. 15v14-3m

Crown's Filtering Heater.—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property.

STEAM Family Chartres Coffee AND SPICE MILLS.

Established July 1, 1866.

FIRST PREMIUM

Awarded by the Mechanics' Fair, 1865, for the best Coffee and Spices.

CHARLES BERNARD, MANUFACTURER OF AND DEALER IN Family Chartres Coffee

SPICES OF ALL KINDS, No. 707 Sansome street, between Jackson and Pacific, SAN FRANCISCO.

Goods of the best quality. Has no fear of Counterfeits—each package bears the signature of C. BERNARD.

Has never employed any Chinese Labor. 15v14-3m

REGISTER YOUR LETTERS containing money addressed to us, or we will not be responsible. Remittances by Express must be in packages, prepaid. When practicable, it is best to remit by draft, or order, on some San Francisco bank or firm.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

**Miner, June 19th:** At the post office in this place may be seen a collection of Tarsish ore, representing the three classes now found in that mine. No. 1 consists of a mass of decomposed substances, which lie in pockets all through the lode. There is about ten tons of this class in the ore-house which will work \$400 per ton. No. 2 is selected from the third by breaking it up small and picking out that which shows ore, even in small particles. There is out about 15 tons of this class which will work \$125 per ton. In No. 3 no ore can be seen, yet it will work over \$20 per ton. There is over 52 tons of this class out. In a box is about a pound of concentrated ore, obtained by washing No. 1 ore in a common pan or horn without crushing, which will assay over \$3,000 per ton.

The Mountain Co. at Silver Mountain has the longest and deepest tunnel in the country. Its length is 1,183 ft. under a very steep mountain. Lately the rock was so hard that it required 150 drills as hard as fire and water could make them to stand a day, making only about ten inches; but recently it has grown some softer. They expect now to make 50 feet per month.

## Amador County.

The Sutter Creek correspondent of the *Alta* of this city, writing June 14th, says: The main shaft in the Hayward mine is now down 1,230 ft., 300 ft. below the level of the sea. Ores are now being worked from the lowest level; 60 tons of rock are crushed in 24 hours. The whole mass of pay rock, between the 700 and 1,230 ft. levels, 500 ft. deep, 500 ft. long, and from 10 to 12 wide is in sight, and ready for extraction.

The Oneida mine has now in sight 100,000 tons of ore, that will pay \$17 per ton, exclusive of sulphurets. The yield of this mine during the last eight months, has been \$135,000.

The present average yield of the Keystone ledge is \$16 per ton. The vein is 10 ft. wide.

**Ledger, June 20th:** Ripley, Crane & Co. are making preparations to commence work on their quartz claim, in Minister's Gulch. They will also commence the erection of a mill immediately.

West Point mining camp was almost totally destroyed by fire last Monday night.

In the Coney & Bigelow mine, rock has been struck, richer than any yet found. The vein is about 10 ft. wide, and the quartz is full of free gold.

## Calaveras County.

**Chronicle, June 29th:** On Lamphear & Co's claim, the lead is developing finely. It increases in width, and the rock taken out would pay handsomely if crushed. Before fall, a large mill will be erected on the claim.

Williams, Fennell & Co. have struck pay dirt in their tunnel in Stockton Hill. As high as \$6 to the pan has been obtained.

Mitchell & Adams are doing extremely well in their claim near French Hill. They are taking out the shining ore in very acceptable quantities, and their claim exhibits no symptoms of exhaustion.

Pink Smith & Co. are pushing forward their tunnel with vigor and determination. They will make the Know Nothing claim pay yet.

## Mariposa County.

**Gazette, June 29th:** The editor has received two very handsome specimens of mineral, known as cobaltine, or cobalt glance, with large quantities of nickel, from the copper mine of Mr. Hammerstrand, on Bear creek. The strata carrying these minerals lies alongside of the foot-wall of the copper vein, and is about 2 ft. thick. The gouge of the ore is quartz and micaceous talcose schist. The width of the vein is 6 ft., with a shaft upon it 60 ft. in depth.

## Nevada County.

The Nevada correspondent of the *Times* of this city, writing from Bear Valley, June 27th, says: The best developed ledge in the district is the Redstone, near Lost Camp, on the North Fork of the American. An 8-stamp mill has been erected, and has been running several months, during which time it has paid its owners the cost of construction and a handsome profit. Between this point and Bear river much prospecting has been done on extensions of the Redstone. The Blue Bell is the narrowest and richest ledge in the district. This ledge is two ft. wide on the surface, and crops out the entire length of its location—2,100 ft. The talc casing of this ledge is rich in free gold; but little gold is visible in the quartz, and

its richness has been demonstrated by actual working tests of several tons run through the Redstone Bros. 2-stamp prospecting mill. Some Blue Bell rock yielded from this imperfect working as high as \$200 per ton.

The Steep Hollow ledge is a location of 2,200 ft., 10 ft. wide at the bottom and 8 ft. on the summit of the ridge. The owners are now running a tunnel, and taking out very rich rock. There is rock enough in sight to run 40 stamp mills. None of their rock has yielded less than \$25 per ton, mill process.

Keenicott & Co. have struck a heavy quartz gravel deposit, which is proving singularly rich.

**Transcript, June 28th:** The claims of Hunter & Frost are paying from \$2 to \$4 per pan. They employ eight hands, and are taking out \$1,000 per week.

July 2d: The North Star mine, at Grass Valley, was sold yesterday, for \$450,000, to W. J. Ralston, A. C. Peachy, W. H. V. Cronise, Delos Lake, Coleman Bros., and others.

Work has been resumed on the Best Chance mine.

Last week a \$40 lump was found in Binsley & Co's claims at Kentucky Flat.

**Grass Valley Union, June 29th:** A clean-up of six weeks' run of Bovee's quartz mine, near Angel's, yielded the handsome sum of \$12,000, and the mines at Angel's, Carson's and Smith's Flat are doing better than ever before.

**Transcript, June 3d:** Several companies have commenced work in the channel of Deer creek. Leeth & Waite have completed a "hurdy gurdy" wheel, four feet in diameter, which they run with 180 ft. pressure, for the purpose of raising gravel from the bed of the creek. John Hawke has claims adjoining the ground just mentioned. He has an overshot wheel for working his hoisting works, and is raising about 25 tons per hour. These two companies employ about 60 hands and expect to clean up in about two weeks.

The lower tunnel of the Grizzly ledge is in about 400 feet from the surface with about 70 feet backs. The ledge is five feet thick and pays first rate.

June 4th: The Kentucky Company, at Moore's Flat, are sinking for what is supposed to be a large basin or channel of blue cement, which, it is thought, is the source of the rich "gold washes" below. The shaft is now about 135 feet below the surface, and it is expected to strike bed-rock at a depth of from 200 to 300 feet.

**National, July 1st:** Eleven loads of rock from the Dromedary ledge, crushed at the Gold Hill mill yielded \$240.10. After the extraction of the free gold, 1,125 pounds of sulphurets remained, which, worked at Larimer's mill, produced \$76.50, making a total of \$319.60.

**EXCELSIOR.**—Meadow Lake Sun, June 29th; The Excelsior Co. are running two batteries (eight stamps) of their mill. The Last Chance Co. are prospecting rock vigorously on their claim. It looks well. It is reported that a rich chimney has been struck in the Gold Run mine. The Chlorination Works below the dam are being repaired.

Rumor says that L. A. Booth and J. L. Requa have purchased a leading interest in the U. S. Grant mine. The late run of the Golden Eagle Co's mill returned a fraction over \$20 per ton. The sulphurets have not yet been worked. They will yield about \$35 per ton.

The California mill is being refitted, preparatory to making a run on ore from the Green Emigrant. The Green Emigrant is yielding exceedingly rich ores. At a depth of 13 ft., the ledge is over 3 ft. wide and rich in free gold. The drift from the bottom of the California Co's shaft has been driven in on the ledge over 50 ft. The rock has been very hard, but is getting softer. The ledge is now 7 ft. in width, at the foot-wall of which is found a thin layer of black copper ore, said to be very rich in both copper and gold. Much copper can be found in its natural state. The balance of the ledge is composed of white quartz, heavily laden with sulphurets, and containing free gold.

## Placer County.

**Herald, June 29th:** One half of the McKinney lode, at Henry's Diggings, has been sold to Mr. Gruher, of Sacramento, for \$10,000; also the Hunt lead, at Loafers' Hollow, sold to Charles Bacon, of Virginia, and others, for \$12,000.

A shaft has been sunk on the Keefer ledge, at Georgetown, 130 feet deep. At that depth a drift was run 25 ft., striking a well defined ledge.

The Flag mill, in Ophir Dist., is crushing quartz for \$2.50 per ton, while the Hogan mill is kept constantly going on good pay-

ing rock. The Pugh mill, also the Welty mill have plenty to do.

The Richard Bullet quartz mill between Ophir and Doty's Flat, has been entirely consumed by fire. Loss \$8,000.

**Dutch Flat Enquirer, June 29th:** Four more stamps has been added to the Redstone mill. A level has been commenced in the mine at a depth of 60 ft., disclosing a better quality of rock than heretofore found.

**Mountain Democrat, June 29th:** The Eureka mine has contributed a number of remarkably rich specimens of gold bearing quartz. The specimens were taken from the vein at a depth of 130 ft. Gold is profusely scattered through the rock.

## Plumas County.

**Quincy National, June 22d:** Times at Sawpit are now very lively. The Eagle Company cleaned up last week the handsome sum of \$28,000. The New York Company also cleaned up \$19,000.

The Eagle Company's claims, at Port Wine, are paying \$200 per month a share. The Monte Cristo claims are also paying finely.

## Shasta County.

**Courier, June 29th:** The re-building of the Mammoth mill is progressing with the utmost despatch under the superintendence of Mr. Sam. B. Grover.

The Chinese Company that purchased Lansdale's garden, at Briggsville, for mining purposes, are taking out excellent pay. The Celestials paid \$1,100 for the ground, and will probably take out \$11,000.

All the companies at South Fork have stopped work, and most of the employes have left for better diggings.

## Siskiyou County.

**Yreka Union, June 22d:** S. S. Richardson, agent of the London Q. M. Co., has gone to San Francisco, to make arrangements to open the lower part of Indian creek. Mr. Thurber's claim on Rattlesnake has averaged, so far, about \$7 per day to the hand. Mr. Thurber's are the only claims opened on that creek yet, but there is without doubt a great deal more ground that would pay for working.

## Yuba County.

**Marysville Appeal, June 29th:** The Bate-man mill, near Indiana Rauch, commenced operations a few days ago. The mill is small, running only five stamps; but it is the intention of the proprietor to add five more stamps as soon as it is advisable.

July 2d: The Pennsylvania is crushing very good quartz, taken from level 8, and the Jefferson, in their southern prospecting drift, have just struck a pay streak of very good quartz.

Several claims are prospecting for quartz containing sulphurets. One of them, formerly supposed to contain copper ore, is now found to be rich in gold, for the ore is yielding \$55 to the ton.

## ARIZONA.

The Prescott correspondent of the *San Bernardino Guardian*, writing June 10th, says: The 20-stamp mill at Wickenburg used in working the Vulture mine, is working to the entire satisfaction of its owners. The mine is also turning out better and better as they go down on it, and is beyond doubt one of the best, if not the best mine on the Pacific coast. It is a source of great regret that the very many valuable mines in this vicinity, are not being worked. The reason for this is, the want of proper machinery to save the gold, after the rock is crushed by the mills.

## COLORADO.

**Georgetown Miner, June 13th:** Work on the Monarch lode, Columbia mountain, progresses favorably. As the mine deepens, better indications are found.

The Sensitive Co. have declared another dividend of one per cent., payable in New York after May 25th.

From three or four lbs. of Bethany ore, smelted in a blacksmith's furnace and then cupelled, \$12 was taken.

Mr. Rockwell has a lot of crystallized sulphurets of silver, taken from a whitish rock in the American lode, which yields 75 per cent. silver.

A proposition to form a silver smelting company is being agitated among the business men of Denver, Prof. Schinner to have control of the works.

Mr. Darrah has been making a hand-stamp mill of himself, and has pulverized 10 lbs. of the ore from the Bunker Hill lode, taking an average of the product of the crevice. Mr. Burlingame will run a button from this ore in a few days.

Mr. J. T. Harris is about to erect a small smelting furnace in the lot adjoining our office. He has bought the W. H. White lode; price, \$2,000. The lode shows an ore vein about a foot thick.

Mr. Hoyt, of Central City, recently made an assay of Muscovite ore, and realized \$70 per ton—\$15 in gold, the balance silver.

For smelting purposes, the Muscovite is the best lode in the country. The New Boston lode, which furnished ore for the first charge of the Georgetown Co's smelting furnace, increases in quality and quantity as work progresses.

Henry Parker has contracted with Mr. Webb, of Georgetown, to sink a shaft 75 ft. on the Congress lode, giving him one-half of the property for the work. The crevice is 5 ft. wide at 40 ft. The dirt from the mine looks like the litharge of the shops. Specimens of the ore, roasted on a stove, show beads of silver on their surface.

The discoverer of the Young America lode, Downville Dist., had a specimen of the ore assayed, getting a return of \$40. He then sold the lode for \$100. Present assays prove that the ore the entire width of the crevice will yield \$4,000 per ton, silver.

The *Register* has the following: We saw at Messrs. Clark & Co's Bank two pieces of bullion, one weighing 6 ozs. and 10 dwts., worth \$119.50, coin; the other contained 3 ozs. and 2 dwts., worth \$54.25, coin—the former from three tons of ore, the latter from 1,940 lbs. These results were obtained by the Kenyon process.

The Boston and Colorado Smelting Co. are preparing to erect smelting and separating works. They will be located below the Excelsior mill, on North Clear creek.

The Althro lode assays as high as \$17,000 to the ton, one-fourth of its value being silver. The Johnson lode yields \$200 per cord in arastras.

**Denver News, June 12th:** Certificate of assay of ore from the Brooklyn ore shows \$68.15 in gold, and \$31.71 in silver, a total of \$99.86 to the ton.

The celebrated Anglo Saxon lode at Georgetown, was sold on Friday last, for \$40,000. Dr. Johnson has purchased 20 tons of ore from the New Boston lode, for \$50 per ton at the shaft. He had lately cupped a button of silver weighing 135½ lbs. He is now running his furnace. Everything is looking flourishing.

Mr. John Shock has succeeded in getting up a company in the interior of Ohio, of \$1,000,000 capital, with \$300,000 for working capital, to open mines in Gold Run, Summit county, Colorado.

**Denver News, June 19th:** Beebe & Company have started their 12-stamp mill. They are running on ore from the Golden Age lode.

A new lode has been discovered on the "divide" between James creek and St. Vrain. The crevice is very wide, and is of dirt, which prospects evenly and richly, fifty cents to the pan.

Mining on the Columbia lode, Ward district, is brisk and the ore looks better than ever before. The Long's Peak Company are working the Comet lode. Several arastras are being put up to run surface quartz. A number of men are mining in Spring gulch, and another in Indiana gulch. They have fair prospects of obtaining a good yield of dust.

## IDAHO.

**Bullion, June 12th:** Mr. Gove had exhibited at the Bullion office the richest piece of ore yet seen in Silver City, which was taken a few days before from the Oro Fino ledge.

**World, June 22d:** The Cosmos Company, of which Dewey is manager, has settled up all past liabilities, and resumed work under bright auspices.

Work on the Poorman mine will commence next Monday. The Company have given the contract for freighting to the amount of \$50,000.

The ore taken from the new ledge of Peck and others, in Silver City, yields very rich rock, similar to the Oro Fino ore.

Very rich ore is being taken from the Oro Fino. The new company have already paid off \$8,000 of indebtedness.

The third clean up of the season was made at the quartz mill of the Elkhorn Company, six miles from Pioneer City, in Boise Basin, last Saturday, and from 70 tons of ore the gold produced was 410 ounces. There is yet over 500 tons of the same kind of ore to crush, and the hands are continually getting out more. The uniformity of the gold product of this mine is a cheering evidence of its enduring richness.

**World, June 26th:** From Ben. Wilson's claim a great deal of money has been taken this season. Two men shoveled in over \$500 one night lately. The claims of Wilson & Giberson have yielded \$2,000 from a five days' run.

The Elkhorn Quartz Co. made another very rich clean-up last week.

One-third of the Summit Flat ledge has been sold to parties in Boise City, who are up there to examine and work it. An offer has been made for the North American ledge on Big Muddy. Mr. Burkett has assayed some of the rock from the ledge, and it yielded from \$500 to \$600 per ton.

A lively mining camp is about to spring

up somewhere on the Middle Boise, between Goodrich's and the Yuha.

Owyhee *Aralanche*, June 29th: The Cosmos mill finished crushing the ore on the yard, and cleaned up, during the week, a large amount of amalgam—more than the grade of ore crushed was supposed to contain.

From 2,500 lbs. of ore from the Morning Star ledge, crushed one day this week, \$370.71 in hullion was extracted. Hallenheck & Stevens have 15 tons of ore from the new shaft in their ledge at the Webfoot mill for crushing.

The Ainsworth mill is being put in order. Ore from the North Star ledge is being hauled to the mill.

One-half ton of Leandia ore crushed at the Webfoot mill, this week, yielded at the rate of \$35 per ton.

**MONTANA.**

Helena *Gazette*, June 15th: The largest gold brick ever seen in Helena, was cast by Bohm & Molitor last Thursday. It weighs 1,000 ounces, and belongs to the hanking firm of L. H. Hersfield & Co. This enormous slug of gold will soon be sent East. Total value, \$17,951.72.

The product of gold from the various mining camps will be quite abundant this season. Most of the old camps are paying well, also many new ones. There is quite a demand for labor. At Blackfoot, Henderson gulch, and in the Silver Bon region, much good mining ground is now lying idle, owing to the scarcity of labor.

The Diamond City correspondent writes: The bed-rock has been struck in King & Gillette's mine, and a piece of gold weighing 56 has been extracted. Yesterday (June 9th) Dennis Shane exhibited a "fat" sack of as pretty dust as ever came out of the ground. The dust was procured on Boulder Bar.

June 22d: Several shafts have been sunk on the public square in Scott's Addition, the prospects from which are favorable. A gravel bed has been discovered five feet deep, and a channel of 51 feet has not determined its width. This gravel will prospect from 7 to 40 cents to the pan; and will average, probably, 20 cents to the pan. There is said to be at least three old channels from Dry gulch to Last Chance, which will all pay very well. Some of the smaller gulches pay from the grass roots down.

Mr. Mansfield, at Highland gulch, has a nugget which was found on claim No. 3, Cooly's gulch, last week, by John Harrington, which weighed 33 ounces; and while visiting Mr. Mansfield's claim, a nugget was picked up by the man on the bed-rock which weighed \$88. Although spring has been very backward in that locality, times are very lively, and those who have their claims in running order are meeting with good success.

**NEVADA.**

Esmeralda. Union, June 22d: Two new mines are being opened on Aurora Hill. The Robert Emmet has a shaft sunk on it near 50 ft. deep; good prospects could be obtained by boring all the way down. The ledge is now six ft. wide. The ore resembles Bodie ore, and is valued at from \$25 to \$40 per ton.

The Holsey mine has been stripped some 300 ft.; crushing from the cropping paid over \$40 per ton.

In Pahdet Dist., the Ithaca, Gulch Lode and Morning Star have on their dumps over 200 tons of ore, that will pay \$250 per ton. Considerable rock from Pahdet has been worked in Aurora, giving very flattering results.

Col. Stevens is preparing to build a large smelting furnace at Begoles Ranch, in Lone Pine district. He has had a large lot of his ore worked in San Francisco which yielded \$285 per ton. J. W. Denny of Gold Hill, Nevada, has contracted with Hughs, Brady & Co., of the Kearsarge Mining Dist., to sink 50 ft. on each of their ledges for an interest in their mine. The Silver Sprout Co. is progressing finely.

The editor saw a bar of bullion worth \$1,446.12 from the Wheeler claim, Pine Grove, the product of 26 tons of ore.

The main shaft on the Juniata mine, is now down 200 ft. In a short time, the Co. will be getting out ore again when the mill will be started.

Humboldt. Unionville *Register*, June 29th: Companies are being organized every day to prospect for gold, silver and copper.

The Cumberland mine far exceeds the most sanguine expectations in extent and quality. There is now out 50 tons of ore, which would be hard to distinguish from the richest Yellow Jacket ore. The Co. are making arrangements to have smelting works erected. Work is progressing rapidly on the Rochester mine. The timbering is nearly completed, and the drift will be resumed in a few days.

Reveille, June 29th: There is on exhibition at the assay office of Boalt & Stetefeldt some specimens from the smelting works of the Trinity and Sacramento Company at Oreana, in Humboldt county. Also, fine samples of ore from the Moutezuma mine, near Oreana, as well as of the casings and country rock. In the collection there are a mass of the crude metal, 1,100 pounds of which are produced from one ton of the ore; a flake of pure antimonite of antimony, as white as snow, from the flue of the refining furnace; a beautiful specimen of litharge from the cupel furnace; slag from the melting furnace; dross, being pure antimonite of lead, from the refining furnace; and eight little bars, the result of "dips" from the refining furnace at various stages. Upon each bar is marked its value in silver and the number of hours it was in the furnace at the moment of the "dip;" the bar from the last "dip" represents 264 hours in the furnace, and contains at the rate of \$385 of silver per ton. The ore from the surface is soft and as yellow as sulphur, but its color becomes darker and its texture firmer at certain points below the surface, and the sample taken from the greatest depth of the mine is compact and of a brownish gray color, and is pronounced to be richer in silver. The specimens of the country rock, which is porphyry, are beautified by delicate impressions as of leaves and plants. The collection was brought in by Mr. John H. Boalt, who returned to town on Friday after an extended visit to several districts in Humboldt county.

**RESE COUNTY.**

Enterprise, June 28th: The correspondent from Pine Grove, Wilson Dist., says: The Pioneer mill has a motive power, a 40-horse steam engine, capable of running 30 instead of 10 stamps as it does. About 18 tons of ore are crushed daily. The gold is saved by running the crude ore over five rows of copper plates, and by concentration on about 40 ft. of blankets. The accumulations on the blankets are afterwards worked again in a single tub. This process of working the ores shows an average yield of about \$33.75 in gold to the ton.

Penrod & Wheeler keeps four arastras constantly running, about a quarter of a mile below the Pioneer mill. The power used in running them is a portable 8-horse engine and hoiler. The owners charge \$15 per ton for crushing, and the ore yields about \$40 per ton.

Parties from Belmont, Pine Grove, Washington and other new districts in that direction are bringing in many fine specimens and excellent accounts of the mines. Nearly every specimen brought in assays pretty well up in the hundreds.

In Lone Pine (or Cerro Gordo) Dist., there are six smelting furnaces, that being the only mode of working ore.

July 2d: The editor has seen a brick of gold bullion, weighing 272 10-100 ozs., value \$4,752.96, \$45 fine, the result of a crushing of 53½ tons of Midas ore at Pine Grove. Work will be resumed on the North American mine in 10 or 15 days. Hereafter it will be known as the American Co., the word North having been dropped.

Reveille, June 29th: A sample of sulphuret has been taken from the shaft of the Plymouth Co. on Lander Hill, which is apparently of a superior quality. The shaft has been pushed with vigor, and is now 85 ft. deep. It is believed that the ore exhibited was taken from the Fuller ledge, which was cut in the shaft near the point of its greatest depth. The sample shows the width of the vein to be about four in., and the ore will give a good yield of silver. This extension of the Fuller ledge will be a valuable addition to the already fine property of the Plymouth Co.

June 28th: By the stage which arrived from the east to-day, 3,000 ozs. of crude bullion were brought from the mill of the Social and Steptoe Co., at Egan Cañon.

Work has been resumed on the Metacom mine. As soon as the water shall be removed, the various works will be pushed with vigor, and a large supply of ore extracted for the mill. In the present condition of the mine there are considerable bodies of ore exposed that will mill from \$60 to \$125 per ton.

June 27th: Arrived this morning 6,000 ozs. of hullion from the Rigby mill at San Antonio, the product of the Liberty mine.

June 29th: J. M. Mattee is exhibiting two certificates of assay of the pulp of ore from the Bennett and Lexington ledges, reduced at the Parrott mills. Bennett yielded at the rate of \$298.59 per ton, Lexington, \$281.56.

July 1st: Arrived to-day, 2,500 lbs. of fine ore from the newly discovered Adriatic ledge, Reveille Dist.

The monthly shipments from Austin by Wells, Fargo, and Co. is \$125,050.26. By Miller & Ripley's fast freight, \$17,500.

Silver Bend *Reporter*, June 29th: The South Atlantic ledge, Reveille Dist., was sold during the week for \$5 a foot. The location comprises 1,200 ft. and is entirely undeveloped. The purchaser will immediately sink a shaft on the mine 200 ft.

Harvey A. Mills and John Grimes have sold mining property in this district to an Eastern company for the sum of \$140,000.

At a depth of 55 ft. below the level of the cut in the Gillilans ledge, from which the surface ore was taken, a level has been run north which is now about 90 ft. in length. Throughout the entire length of this gallery the vein is of striking uniformity, averaging about 6½ ft. in width, and of remarkable richness. Most of the ore will yield \$100 per ton, while the entire mass without assorting is profitable milling ore. The vein carries much of the black, compact and rich mineral stetefeldtite, which assays thousands of dollars.

The Silver Bend Co. recently had 100 tons of Transylvania ore worked, at the Belmont Co's mill, in order to determine the best mode of working it. It was treated by the ordinary wet crushing process, and about 60 per cent. of the silver was saved. The pulp assay of the 100 tons was \$101.89. Wastoe.

[In the Stock Circular, in another portion in this paper, will be found late mining news from this district.]

Enterprise, June 26th: The new machinery of the Petaluma mill will be ready to start up about the last part of the present week.

June 27th: Nineteen bars of bullion from the Savage mine has been assayed at the assay office of the Gould & Curry; their value exceeds \$40,000.

June 28th: The Gold Hill Quartz M. & M. Co. next month, will pay a dividend of \$75 per share, almost \$600 per foot.

June 29th: Wells, Fargo & Co., during the last week, shipped 8,942 lbs. of hullion valued at \$120,021.98.

Gold Hill *News*, June 27th: The Savage mine sent \$30,000 worth of bullion to San Francisco to-day.

**OREGON.**

The *Oregonian* says that parties from Grant county are now in that city for the purpose of purchasing a quartz mill, if they can do so profitably. The mill is to be located on the middle fork of John Day's river, in the immediate vicinity of rich leads of mineral. They report times as being better now than they have been for a year. It has been ascertained to a certainty that there are numerous rich and valuable leads in that county.

Salem *Record*, June 20th: Cooper's coal mine is on Bette creek, Marion county. One man is at work at the mine, opening tunnels and extracting coal. Several openings have been made; the principal one is in 40 feet. The coal bed dips into the hill, showing a strata of excellent coal two feet thick. Mr. Cooper has about 20 tons of coal out.

**QUARTZ MINING IN BRITISH COLUMBIA.**

Some considerable attention is now being given to quartz mining in British Columbia. Developments, during the past year, go far to prove that valuable lodes of the precious metals exist in various parts of that country. A correspondent at New Westminster furnishes us the following items:

At Shuswap District, "The Cherry Creek Silver Mining Co., Limited," have had three samples of ore assayed at the Government assay office, with the following result: Specimen No. 1, taken from the Black Ore lead, gives 1,591 ozs. of silver and 6 dwt. of gold to the ton; specimen No. 2, taken from the Hillside claim, above the present working, gives 1,259 ozs. of silver, with traces of gold; specimen No. 3, from the present working tunnel, gives 1,603 ozs. of silver, with traces of gold.

The Washburn Co., Cañon creek, Cariboo District, are at present taking out very rich gold-bearing quartz, and expect to have two large arastras in operation by the first of July.

COMPRESSED GUN COTTON.—This article is now manufactured for mining purposes by first making the cotton explosive in the usual way; this is placed in a pulping machine, and reduced completely to pulp. It is then compressed by hydraulic machinery, so that one inch length of charge of any given diameter is equal in explosive force to six inches of gunpowder filling the same bore. The cotton could not be put into a more portable form, and by bringing the charge nearer the bottom of the hole, it is apparent that its use will considerably lessen the labor of drilling, for the drill hole need not be so deep as when gunpowder is employed.

**Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!**

**REASONS WHY.**

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, he is ac nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium of State Fair.

**Opinions of the Press and others in regard to Bussey's Combination Lock.**

The Bank of British Columbia ordered the first one of those locks introduced in this city, and the following recommendation has been received by the inventor:

**BANK OF BRITISH COLUMBIA,**  
San Francisco, May 24, 1880.

Recently, two of Wm. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor, and in every way meet our fullest approval. They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost unnumberable.

As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it.

WM. H. TILLINGHAUST, Sub Manager.

We do hereby certify that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and indisputable to be hooked. We have applied several to Vaults and Safes, to entire satisfaction to parties interested.

KIETZBEG & LEAVITT,  
Pioneer Iron Works, cor. Fremont and Market sts.

SAN FRANCISCO, May 6, 1887.

I do hereby certify, that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safes and Vaults in every other respect as good as any other improved combination lock which I am acquainted with.

JOHN R. SIMS,  
Vault Manufacturer, Oregon street.

JACKSON, April 27, 1887.

I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons:

1st.—Because it is impossible for either burglar or expert to pick it.

2d.—The lock being constructed without a key-bolo, it cannot be blown to pieces by powder.

3d.—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making.

R. COSNER,  
Attested by J. C. SHEPMAN, County Clerk.

JACKSON, April 27, 1887.

The undersigned, Treasurer of Amador County, do hereby certify that I am now using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's Safe. I have no fear of any bystander gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe every few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it.

OTTJ. WALLBER,  
Attested by J. C. SHEPMAN, County Clerk.

CALIFORNIA LOCK AHEAD.—A special premium was awarded Mr. W. C. Bussey for his improved Combination Burglar and Powder-Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the Press several months since. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable claims asserted in favor of the Lock at that time, have been fully sustained by its practical use. We feel an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates.—[Mining and Scientific Press, Sept. 23, 1886.]

They are the only safe lock ever invented. Every State and County treasury vault, and every bank and business place should have one.—[Amador Ledger.]

This is a lock with which a series of rotating annular tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with two or more screws connected with one or more bolts, whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. For which we had awarded a special premium at the State Fair.—[Sacramento Union.]

We, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar Proof Lock to be the most reliable lock constructed.

F. MARKT & C. E. ASHLEY,  
No. 13 Post street.

L. McLANE, }

Any good locksmith can put this lock on safe doors. Bored a single oil hole removed and this placed in their stead, to work one, two, three or four bolts, as the case may be.—[See page 30 in Pacific Coast Directory.]

A deaf or blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination.

## Notices to Correspondents.

OUR CORRESPONDENT is informed that in almost all cases the diamond has been found in connection with alluvial gold washings. Thus, Mr. Patterson, Director of the Mint in Philadelphia, so long ago as 1857, described no less than nine specimens in the gold placers of the southern Alleghenies, as was predicted by Humboldt, who also anticipated the same as regards the Altaic district, and was fortunate enough to personally realize the latter prophecy by placing in the hands of the reigning Czarina of all the Russians the first gem of this kind ever found in that part of Central Asia. Diamonds have also been found in the alluvial gold fields of Australia and the Urals. It would therefore be an exceptional case if these rare articles had not been found in analogous localities and similarly associated in California and Montana. The diamond found along with gold in washing the river beds of Brazil is well known, and from description we infer that the magnificent gems which have rendered Golconda so illustrious are somewhat similarly found. Mr. Patterson, above alluded to, in the annual report for 1847-8, is stated to make mention of three diamonds having been found amongst the gold washings of North Carolina.

INVENTOR, Gold Run, Cal.—Any device for the application of water direct to the working of stamps, without the intervention of an engine or water wheel, would doubtless be novel and patentable. Steam has been so applied, but not in such a manner as to admit the use of either steam or water. We cannot express any opinion as to the economy or practicability of your invention without knowing more of its details. The matter of a much less first cost would be an important item in its favor, if it is not obtained at a sacrifice of practicability. If you would send us a rough drawing, or, better still, a model of your invention, we should probably be able to express some decided opinion with regard to its merits.

AN ISRAELITE is in error in considering that gold and silver coins were minted in Judea much earlier than the time alluded to in our reply to W. M., in our notices to correspondents which appeared on the 1st inst. The earliest Hebrew coin is of the date of the Maccabees. From the nineteenth century, B. C., when Abraham weighed to Ephron 400 shekels of silver as the price of the cave of Machpelah,\* until the second century, B. C., when Antiochus Sidetes gave permission to Simon Maccabæus to coin money "with his own stamp."† There cannot exist a doubt but the shekel morely meant, as its name implies, a certain denomination in weight.

\*Genesis XXIII v. 16.  
Maccabees XV v. 6.

AMALGAMATOR, VIRGINIA CITY.—The distillation of mercury and amalgam of that metal by means of superheated steam, was recommended by Niolette nearly 20 years ago, as can be seen in the *Comptes Rendus* 31, page 546, and *J. Pr. Chem.* 51, page 313.

CORRESPONDENCE.—"Quicksilver Mining in Monterey County," next week.

## Pacific Railroad—Interior Trade.

In a short time the locomotive will cross the Sierra Nevada, and deliver goods from this city to the valley of the Humboldt. Although less than 200 miles will be accomplished in distance, a difficulty in transportation of fully 500 miles will have been overcome; and we shall have nothing but plains between the railroad terminus and the various mining localities of the Great Basin and the territories to the north. San Francisco will then be brought practically 500 miles nearer to those great places of consumption, than she is now. Land carriage across these plains, after the mountains are crossed, is comparatively cheap, as the stock can be readily fed by the way.

In the progress of the eastern division of the road, more than double the distance of the western division, has been accomplished; but it has been over a level plain. That portion of the road is now approaching the great barrier of the Rocky Mountains, where its progress will become slow and expensive. That which has been already finished, is of but little account as a means for transportation to Salt Lake, or any portion of our territory west or north of that point. Hence, so far as the business of this city is concerned, nothing has yet been or will be immediately accomplished, to interfere with our interior trade, even under the old basis; but the advantage which we shall soon gain, will be immense, by the complete removal of our mountain barrier.

The result will be a more rapid filling up of the interior, and the more economic working of mines, which, under present circumstances, can scarcely be worked at all on account of the great cost of transportation. Intimate business relations will also spring up between the merchants of those localities and this city, which future advantages, on the eastern route, can with difficulty break up, even with slight advantages in their favor.

The prices of most goods in St. Louis and Chicago, which are in demand in the interior, are about equal with those of this city—if anything, San Francisco has the advantage, especially in breadstuffs, dried fruit, East India goods, and provisions generally. Heavy mining and other machinery forms no exception to this rule; or if there should be a small advantage the other way, the acknowledged superiority of California made mining machinery, over that made at the East, will always give quite a margin in our favor. We have often explained the cause of this superiority—the nature of which is such, that but very little chance exists of its ever being removed.

Another and inseparable advantage in favor of San Francisco, is distance. The distance from San Francisco to Salt Lake City, or the most distant mines of the Great Basin, or those of Idaho or Montana, by the route of the Continental Railway or any branch which can be constructed therefrom, is less than one-half that from St. Louis or Chicago. The running cost per mile of road on the eastern or western division, will be about the same; or at worst, that of the western can exceed that of the eastern but a trifle. The first cost of the chief commodities being about equal, the difference in extent of transportation must forever give San Francisco an advantage, which nothing but the most unwarrantable mismanagement can deprive us of. A change of the seat of supply, when once located here, (as it must be for reasons already shown) to our western rivals, will be a matter scarcely to be thought of. The future advantage that awaits this city from the interior trade that must soon grow up in this vast region, cannot be estimated. It belongs to San Francisco as legitimately as does that of Shasta or San Diego.

THE Erie Railway Company, in New York, it is stated, are about doing away with the use of wood on their locomotives, and have already commenced selling off the wood they have on hand. Coal is to be used hereafter.

FIRE-PUMP TRIAL.—We were present, among others, on Tuesday last, at the Occidental Hotel, to witness a trial of the Excelsior double-acting Force-Pump, which Mr. Leland has recently had placed in that hotel, for greater security from fire. The pump is located in the engine room, in the basement, and forces water through iron pipes from thence to the top of the building, being fed from the street water pipes. In the hall of each story of the main stairways a hose is connected with this pipe, through which water may be conducted to every room in the house. Previous to placing this pump in the building, reliance was had, in case of fire, upon the pressure of the water mains. This reliance was fatal at the Cosmopolitan, which was provided with a similar protection. When the fire took in the ceiling of the upper story of that hotel, there was not sufficient head to force the water six inches from the nozzle of the pipe, and when the engines arrived the city hose burst, and by the time that defect was remedied the flames had got beyond the control of the Department.

Mr. Leland has now provided himself against such a contingency by setting up one of these pumps, so that, in case of need, it may be instantly connected with the engine, and water thrown over any part, the roof of the hotel, or adjoining buildings, thereby being independent of the head in the street main. In the trial of Tuesday, at 35 strokes per minute, (which might have been increased to 50) the water was thrown from the floor of the basement to the floor of the upper story; and from the hose in the upper story it was readily thrown to all parts of the roof. The test was most fully satisfactory to most of the witnesses; although Capt. Cushing, the agent of these pumps, pronounced it unsatisfactory to himself, as it did not do as well as it had done on previous trials. The Captain explained the matter the next day, by ascertaining that the company's water meter, through which the pump derived its supply, had burst during the trial, thereby greatly interfering with its performance. To our mind, however, the test was fully satisfactory as it was, and we congratulate Mr. Leland and his guests on this additional security from fire. Two of these pumps were shipped by the Colorado, on the 4th instant, for Yokohama, having been especially ordered by Mr. E. M. Van Reed, of that city.

A NEW COMMERCIAL JOURNAL.—John H. Carmany & Co. will issue, in season for the next steamer, a new Commercial Journal, to be entitled *The Commercial Herald and Market Review*. Its editorial department will be under the control of H. Channing Beals, a gentleman long and favorably known in the commercial circles of this city. The financial and general stock market reports will be placed in charge of gentlemen of long experience in those departments. It is intended to make it a first-class commercial journal, and one which shall fairly and ably represent that great and growing interest in this city.

FINE PAINTING.—There is a spirited painting to be seen in the show-window of Snow & Roos, by the French artist, Narjot, entitled "Life in Arizona." It represents a skirmish between a small party of American soldiers and some Apaches. The scenery is from nature, being located on the Ranch of San Pedro, in Arizona. The artist has been himself a party in several encounters with the Indians, and paints with a truthfulness and spirit inspired by the reality. Mons. Narjot is already favorably known as a portrait painter, and he will lose nothing from the public by this new effort of his genius.

CORRECTION.—In the first item under our patent head of June 22d, copied from the *Sacramento Union*, Mr. I. H. Graves was spoken of as the foreman of the Pacific Railroad machine shop; he is the master mechanic of the road. Mr. James Gerrish is foreman.

THE PACIFIC CHEMICAL WORKS.—MESSRS. Falkenau & Hanks, the enterprising proprietors of these works, signalized the first annual recurrence of their establishment in business by a social gathering on the 29th ult., which was attended by a large number of their personal and business friends. These works are located at the corner of Center and Folsom streets, near the Mission, and cover quite an extensive area of ground upon which the several buildings necessary for their varied manufacture are built. It gives us much pleasure to learn that these gentlemen are meeting with a most satisfactory degree of success in their enterprise, as manufacturing and consulting chemists. Their works are well fitted up with all the necessary means and appliances for the manufacture of nearly or quite every kind of chemical called for, to any considerable extent, on this coast; and they have a full and carefully arranged case of re-agents, for testing minerals and chemicals. Druggists, dyers, daguerreotypists, and others, who deal in or otherwise employ chemicals, acids, etc., will always find at this establishment those which are equal to the best and purest in the market. Messrs. Falkenau & Hanks, being both practical chemists, give their unremitting and personal attention to every department of their manufacture. Among other things, they manufacture large quantities of cyanide of potassium, which is now being considerably used by quartz miners as an aid in amalgamating. Nitrate of silver also forms a large item of their manufacture; also, nitric, muriatic and sulphuric acids. Analyses of ores, minerals, waters, metallurgical products, soils, etc., as well as assays of ores, are made at this establishment.

THE COMING WHEAT CROP.—The present indications are that the California wheat crop for the present year will not quite equal that of the year past, although a very abundant harvest may be expected. Prices here will not vary much from last year, although they will not probably rule as high in New York. The difference will come out of the middle men. This class of men, owing to the close "corner" which had been effected, and which was kept up with most signal success, made enormous profits out of their operations last winter. They will have to be content with less this season, while the growers, and especially the California growers, will probably realize quite as much as they did by their last crop. It is stated in the last monthly report of the Agricultural Department "that the yield of wheat in all the States where that grain is raised will be much larger than usual." Later advices by telegraph, however, do not speak so hopefully; and the prospect now is that the crop will be nothing better than a usual one. The old crop has been very closely exhausted, so that there will be less to fall back upon than usual. This will open a good market for California. Our wheat-growers have every reason to be hopeful, and should not sacrifice their crops to the gain of greedy speculators.

THE FOURTH passed off most pleasantly and happily to all. But one or two accidents of any kind have occurred, and those not of any very serious nature. The fireworks in the evening eclipsed any ever before seen in this city, and were witnessed by a crowd variously estimated at from thirty to forty-five thousand. They were from the establishment of Church & Clark, and reflected the highest credit upon their pyrotechnical skill.

METALURGIST.—A PRACTICAL metallurgist, experienced in all branches of his business, and particularly in the manufacture of tough copper, wants employment. His address can be had at the office of the Mining and Scientific Press.  
2v14-4w\*

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the *MINING AND SCIENTIFIC PRESS*, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

**AMUSEMENT WITHOUT TEMPTATION.**—Parents will find Woodward's Gardens free from the temptations too often presented at public places of resort; while the gymnasium, the birds and animals, and the meandering walks around the trees, flowers and shrubbery of the ground, cannot fail to delight both parents and children.

**Cholera—Perry Davis' Vegetable Pain Killer.**

Mr. PERRY DAVIS—Sir:—The benefits I have received from the use of your invaluable remedy, the Pain Killer, induces me to pen a word in its praise. Experience has convinced me that for Headache, Indigestion, Pain in the Stomach, or any part of the system, severe Chills, Weariness, common Colds, Hoarseness, Cholera, Cholera Morbus, Diarrhoea, Dysentery, Toothache, etc., there is nothing better than the Pain Killer. I have this hour recovered from a severe attack of the Sick Headache, by using two teaspoonfuls, taken at thirty minutes intervals, in a wine glass full of hot water. I am confident that through the blessing of God, it saved me from the cholera during the summer of 1843. Traveling amid dust, toil, change of diet, and constant exposure to an infected atmosphere, my system was daily predisposed to dysentery attacks, accompanied with pain, for which the Pain Killer was a sovereign remedy, one teaspoonful during the worst case in an hour, or, at most, half a day! I have heard of many cases of Dysentery being cured by its use. Put in the teeth, it will stop the toothache. Gratitude, and a desire for its general use, has drawn from me this unsolicited testimonial in its favor.  
D. T. TAYLOR, JR., Minister of the Gospel.  
Sold by all Medicine Dealers everywhere. 22v14 1m

**HENDY'S LATEST IMPROVED CONCENTRATORS,**

**FOR GOLD AND SILVER ORES,**  
With Revolving Stirrers and Rotary Distributor.  
Can be seen in Operation at the Union Foundry, First St., San Francisco.

**Directions for Operating Hendy's Concentrators:**

- First—Set the Pan, A, level, by its inner rim.
- Second—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]
- Third—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
- Fourth—The crank shaft to make 200 to 220 revolutions per minute.

The above directions, if followed implicitly, are all-sufficient. But, strange as it may appear, the proprietor has found that, in certain cases, they have, owing to the carelessness or to the ignorance of the operators, failed to serve as a complete guide. He, therefore, in the present edition of his circular, insists upon their being followed to the letter; and in order that there may be no mistake in futuro, he thus elaborates and explains them:

First, then: Unless the pan is level, it is out of the question to expect it to do its duty. One would imagine that the slightest possible examination of the illustrations would be sufficient to show this. Yet, in one case, where the machine did not work satisfactorily, it was found that no regard whatever had been paid to this point! The word level is in itself precise; it admits of no latitude, and cannot be misunderstood. Nothing is easier, to a mechanic, than to place the pan absolutely and mathematically level. It cannot be necessary to dwell further upon this point.

Direction Second, viz:—"Keep the pan about half full of sulphurets," has also, in some cases, been disregarded. A moment's reflection will point out its importance. The operation of the machine is such, that grains of any kind, whatever may be their size or weight, will seek the periphery of the pan, and unless discharged, will there remain, until other grains of greater specific gravity take their place. Of course, then, at the starting of the machine, and for a short time thereafter, the periphery will be partially filled with sand. It is therefore necessary to allow a quantity of sulphurets sufficient to completely occupy that space to accumulate, before the gate is opened, and their discharge commenced. It is obvious that they will otherwise be accompanied with more or less of sand. Once properly commenced, the discharge will be continuous. It must be regulated, however, by the richness, in sulphurets, of the pulp under treatment. A little practice will enable the operator to gauge it without difficulty.

After what has been said, direction Third requires no further explanation. Direction Fourth is, to a mechanic, sufficiently explicit.

These concentrators can be set in pairs, for which a single crank shaft will suffice. Two such pairs can be so arranged as to require a driving shaft of only six feet in length.

The guaranteed capacity of each machine is five tons every 24 hours. Eight tons, however, can be and has been put through in that time. The small proportion of sand which the sulphurets carry, when thus rapidly concentrated, is not an objection but rather an advantage, in case the operators themselves intend to work them. Either in roasting or in pan-working, a small admixture of sand is unquestionably an aid. But if the sulphurets are being prepared for sale, they must of course be clean. In this case, the discharges from four machines can be conducted into a single additional one, and the concentration thus be made complete.

The proprietor has recently still further improved the machine, by the substitution of an iron frame for the former wooden one. While nothing is added to its weight by the change, it is thus made stronger and more compact; and at the same time the labor of setting it up is considerably lessened. He flatters himself that these added advantages leave nothing further to be desired as regards the perfecting of the machine.

Orders addressed to PACIFIC ROLLING MILL and FORGE CO., Post Office, San Francisco, Cal., will receive prompt attention.

The highest price paid for Scrap Iron. 9v14 3m9p

**A. S. Hallidie & Co.,**

MANUFACTURERS OF  
**FLAT & ROUND WIRE ROPE,**

For Mining, Shipping, Ferry,

AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach

SAN FRANCISCO.

NOTICE.—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hemp Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on the Coast, and to many of whom we refer those interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size whether for wire or hemp rope.

We manufacture of all sizes, and in any length—

**Round Wire Rope—Iron or Steel, for Hoisting.**

**Flat Wire Rope—**

**Soft Steel Wire Rope—For Derrick Fall Ropes—**

very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

**Galvanized or Ungalvanized Round Wire Rope—For Ships' Rigging, Derrick Guys, Ferry Ropes, and all standing purposes.**

**Steel Ferry Ropes—For wide streams. Ferry Blocks supplied.**

**Iron and Copper Wire Cord—1/4 to 3/4 inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.**

Comparative Weight, Size and Strength of Iron Wire Ropes, Steel Wire Ropes, Hemp Ropes, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.
Wt. per 100 ft.	Wt. per 100 ft.	Wt. per 100 ft.	Size in Link.	Depth in Str. Load.
2 83	1 31	5 100	3/4	7 2,500
2 83	2 55	6 130	3/4	3 11 3,700
3 170	2 91	8 236	3/4	6 33 6,300

pamphlets containing data, with prices appended, forwarded free, by mail or express, on application to manufacturers.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Rag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Pumps, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Out-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Fire, Tubular, Upright, Cylinder and Cornish, and every variety of boiler work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's improved Tractory Crive Pan, Zenus Wheeler's improved flat bottom pan, Beldin's pan, Yeatch's tubs, Frater's concentrators, Walker's pans, Beer's pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Gams, Pans and Tubs, BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT.  
24v12 H. J. BOOTH & CO.

**A NOVEL GUNBOAT.**—The latest novelty in naval architecture is a gunboat designed by Mr. John Ericsson for the defense of the Swedish coast. It is an ironclad, and is smaller than gunboats usually are. The deck is entirely below the level of the water, and is strongly protected with plating. From the deck rises a kind of sheath, oval and open at one end above the water, and in this is worked a 15-inch gun, which points always in the direction of the bow. The motive power is applied, not by steam, but by the arms of thirty-two men, who act by a simple and effective mechanism on a screw with four flanges. This gunboat, which is already constructed, is said to be admirably adapted to the defence of the islands and bays and inlets and the lakes of Sweden. The power obtained is sufficient for the required purpose, and the total cost of the boat is but little over \$20,000.

**REMOVAL OF FIRE-DAMP FROM MINES.**—A Mr. Williams, from Blairfin, Wales, has been illustrating, at Barnsley's Gas Works, a scheme, by which he states coal mines may be cleared of fire-damp. The desired result is proposed to be obtained by the use of an apparatus consisting of an inverted syphon, to which is connected a pipe from the mouth of the shaft. The short end of the syphon is inserted in the place containing inflammable gas, and the pipe from the top is attached to the other end. The air first being extracted from the pipe, the gas, which is lighter than the atmosphere, will rise to the top. The experiments were, it is said, successful, and witnessed by several mining engineers.

**DR. RICHARDSON** states that iodine placed in a small box with a perforated lid destroys organic poisons in rooms. In cases of small-pox he has seen this method used with great benefit.

**LAST MARCH**, a coöperative company for the manufacture of furniture was formed in Cincinnati, with a capital of \$2,000,000, in shares of \$100.

**A CHIMNEY** at Thompsonville, Conn., 100 feet high, and containing 100,000 bricks, was moved recently a distance of seventy feet without damage.

Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 25v12-3m

**IMITATION OF MAHOGANY.**—French mechanics will make a perfect imitation of mahogany out of any close-grained wood in the following manner: The surface is first planed smooth, and then rubbed with a solution of nitrous acid. Then apply with a soft brush, the following mixture: one ounce of dragon's blood, dissolved in about a pint of spirits of wine, and with the addition of a third of an ounce of carbonate of soda, mixed and filtered. When the polish diminishes in brilliancy, it may be restored by the use of a little cold-drawn linseed oil. Dragon's blood, as most of our readers know, is a resin obtained by incision from certain plants, and is sold at the druggists to the varnishers and marble-stainers. This method, which is extensively employed in France, might be well adopted in the United States for the interior decorations of our dwellings, etc.

A HUNDRED million dollars, it is said, are annually sent to England from this country for cast steel.

FRANKLIN K. FELTON. JAMES M. TAYLOR. FELTON & TAYLOR, Attorneys and Counsellors at Law, Court Block, 636 Clay Street, SAN FRANCISCO. Will practice in the State and Federal Courts. Special attention given to proceedings under the Patent Law. 18v14-1q

GEO. T. KNOX and E. V. SUTTER, COMMISSIONERS OF DEEDS. NOTARY PUBLIC, 615 Montgomery Street, San Francisco. 16v14tr

ISAAC LOBREE & CO., GOLDEN STATE POTTERY, ANTIOCH, CAL. Office in San Francisco, 516 Commercial st. Constantly on hand a large assortment of Earthenware, Fire Bricks, Fire Clay, and Stoneware. Is prepared to fulfill all orders at the shortest notice. 20v14tr

J. N. ECKEL, M. D., Homeopathic Physician, 226 Post Street, San Francisco. 21v14yr

DR. H. AUSTIN, DENTIST, No. 634 Washington Street, Between Montgomery and Kearny Streets [OVER SAN FRANCISCO BATHS] SAN FRANCISCO. 20v10-4y

J. W. WINTER, DENTIST. Office, 617 Clay street.....San Francisco. First-class gold fillings for \$3, as good as any dentist can produce in the city. Dr. Winter has practiced Dentistry twenty years—fifteen in this State. For a full upper set of gum teeth, on vulcanite base, from \$30 to \$35. Teeth extracted without pain by local application. 18v14-4f

RADICAL CURE OF RUPTURE!

Treatment of all Deformities of the Body, by DR. A. FOLLEAU'S process. 424 Washington street, up stairs, Washington Baths Building, between Montgomery and Kearny streets.

DR. A. FOLLEAU Has his studies and manufactory in the same building. Every kind of Apparatus, Trusses, orthopedic Instruments, Artificial Limbs, etc., are manufactured and applied by himself. He has no connection with any Agency. 21v14-11p4f

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION! The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. BLAKE & TYLER, 14v14tr Agents for the Pacific Coast.

Greatest Invention of the Age.

BOWMAN'S AMERICAN WASHING COMPOUND

And house-wife's true friend, saves one-half the labor, one-half the time, and one-half the expense. For WASHING CLOTHES, CLEANING HOUSES, REMOVING PAINT, GREASE, etc., it is unequalled. It makes hard water as soft as rain water. For sale at \$1.50 per can of five gallons, at the manufactory, 223 Jackson street, near Battery. Please send your orders, by mail or express, to LYNCH & PARSONS, 23v14-2am6f San Francisco, Cal.

Metallurgy.

BOALT & STETEFELDT, Metallurgists and Mining Engineers AUSTIN, NEVADA. Western Branch of ADELBERG & RAYMOND, No. 90 Broadway, New York. 11v11

O. W. MAYNARD. J. H. TIEMANN. MAYNARD & TIEMANN, Mining Engineers and Metallurgists, 240 Pearl street, New York, CENTRAL CITY, COLORADO. 19v12-1y

REMOVAL. PACIFIC CHEMICAL WORKS.

WALKENAU & HANKS HAVE REMOVED THEIR OFFICE to 623 Montgomery street, opposite Montgomery Block, where they will receive orders for Chemicals of all descriptions, and for Assays and Analyses of Ores, Minerals, Metallurgical Products, Mineral Waters, Commercial Articles, etc. Laboratory, corner of Center and Folsom streets, Mission. 21v14-4w

EUROPEAN METALLURGICAL WORKS, Practical Mining School, Bryant Street, Between Third and Fourth, SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character. After a careful analysis has been made, Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyrites and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, retuling by euepilation, done at moderate rates.

PRACTICAL MINING SCHOOL. The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business. S. P. KIMBALL, J. R. MURPHY. 10v10

J. A. BAUER, Chemical Laboratory, AND DRUG STORE, 644 Washington Street. [Established 1849.] SAN FRANCISCO. Careful Analyses made of Ores, Minerals, Waters, Oils, Liquors, Wines, Products of Art, etc. Pharmaceutical Preparations Made to Order. Opinions given on Chemical Questions and Geology. Particular attention paid to Analyses of all kinds, in cases where legal questions are involved. Pure Nitric Acid, Nitrate of Silver, Gold Chloride, Platin Chloride, Sodium Amalgam, Sulphate of Copper, etc., for sale. 12v14-6m

Pacific Mail Steamship Co's STEAMSHIPS FOR NEW YORK, JAPAN AND CHINA. LEAVE FOLSOM STREET WHARF, AT 11 O'CLOCK, A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPENWALL for NEW YORK. On the 10th, 18th and 30th of each month that has 30 days. On the 10th, 19th and 30th of each month that has 31 days. When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following. Steamer leaving San Francisco on the 10th touches at Matzarah. All touch at Acapulco. Departures of 14th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Holders of orders will be required to identify themselves to the Agents in England. For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO. On the 24th, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting at Yokohama with the steamer COSTA RICA for SHANGHAI. For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets. OLIVER ELDRIDGE, Agent.

Blanks, Blank Mining Books, Constitution and By-Laws - FOR - Mining and Prospecting Companies Elegantly printed, with care and dispatch, at the office of the Mining and Scientific Press. Orders from the interior faithfully attended to.

FACTS FOR THE PEOPLE—Every family should have a bottle of Healy's Curative Oil in the house, prepared to annihilate pain.

New Mining Advertisements.

Chico Senores Gold and Silver Mining Company.

Notice—There are delinquent, upon the following described stock, on account of assessment levied on the first day of May, 1887, the several amounts set opposite the names of the respective shareholders as follows:

Table with 4 columns: Name, No. Certificate, No. Shares, Amount. Lists names like Haywood Junion, J.C. Heidemann, etc.

And in accordance with law, and an order of the Board of Trustees, made on the first day of May, 1887, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, No. 523 Clay street, San Francisco, Cal., on Saturday, the twenty-seventh day of July, 1887, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

EDWARD C. LOVELL, Secretary. Office, No. 523 Clay street, San Francisco.

To Capitalists.

GOLD QUARTZ MINE, SITUATED IN CALAVERAS County, with steam mill fitted up with ALMAGERAS Pans, etc. FOR SALE.

BELOC FRERES, Bankers, 635 Clay street, San Francisco.

Mining Notices--Continued.

Adella Gold Mining Company, Rock Creek, Sierra County, California.

Notice—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-ninth day of May, 1887, the several amounts set opposite the names of the respective shareholders as follows:

Table with 4 columns: Name, No. Certificate, No. Shares, Amount. Lists names like E.F. Bauldwin, etc.

And in accordance with law, and an order of the Board of Trustees, made on the twenty-ninth day of May, 1887, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Olney & Co., auctioneers, at No. 418 and 420 Clay street, San Francisco, Cal., on Monday, the fifteenth day of July, 1887, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Office, N. E. corner Froot and Clay streets, San Francisco.

Important to Californians—Many inventors have lately had their claims for Patents seriously and in some cases fatally delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations.

These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

Office, 121 Sutter street, San Francisco, Cal.

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco.

Machinery.

STEWART'S CELEBRATED HINGED Grinder and Amalgamator.

Is the Cheapest and Quickest Pan Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the muller to better advantage than any other Pan in use...

VARNEY'S PATENT AMALGAMATOR. These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner...

This Amalgamator Operates as Follows: The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces...

FOR SALE! PATENT RIGHT OF HUNT'S WINDMILL for the State of California or the whole Pacific Coast.

NELSON & DOBLE, AGENTS FOR Thomas Firth & Sons' Cast Steel, Files, Etc., Shear, Spring, German, Plow, Blister and Toe Calk Steel; manufacturers of Mill Picks, Sledges, Hammers, Picks, Stone Cutters, Blacksmiths' and Horse-Shoers' Tools...

SAN FRANCISCO BRUSH FACTORY, No. 211 California st., manufactures to order all kinds of BRUSHES.

At lower prices than cost of Eastern importation. Brushes for all classes of machinery. A superior Scrubbing Brush from soap Root fiber; also, Sluice Brushes from the same material...

To Quartz Miners and Others. NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the HITCHENS' ORE PULVERIZER. It is now in operation at the South Park Saw Mill, on Brannan street, between Third and Fourth streets...

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Smashing Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction...

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off...

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mining Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-PLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found to be the most economical and efficient mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations are afforded on application to the subscribers.

LEFFEL'S American Double Turbine WATER WHEEL.

THESE WHEELS, UNEQUALED AND UNRIVALED IN the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, saw Mills, Flour Mills, Quartz Mills, etc., etc.

\$85 for Hunter's Improved Concentrator.

The patentee is prepared to sell his Concentrators for the above price, and guarantees, when the machines are run according to directions, to give 20 per cent better results than from any Concentrator built on this Coast...

HUNTER'S EUREKA AMALGAMATOR. For sale, the right to build and use in mills. A working plan will be furnished each purchaser. First-class machines can be seen in operation at the Eureka Mill, Grass Valley. The cost of the iron for the machine, without the iron-box, is about \$100. The box will answer of wood.

Hunt's Globe Pump

Is extensively employed for raising water by hand or wind mill power, for houses or garden use. I manufacture five sizes, from 3 to 8 inches diameter in the chamber. These Pumps are all fitted for iron or lead pipes. They are very durable and easy to repair.

No. 3.—3-inch Chamber, 6-inch Stroke. No. 4.—4-inch Chamber, 6-inch Stroke. No. 5.—5-inch Chamber, 6-inch Stroke. No. 6.—6-inch Chamber, 10-inch Stroke. Manufactured at No. 23 Second street, and 110 Jessie street, San Francisco, by E. O. HUNT, Windmill Builder.

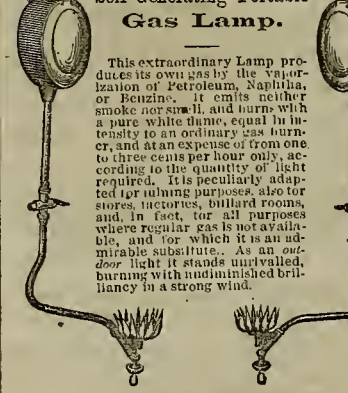

HEALTH! HEALTH! Contracted by Inhaling the Noxious Gases of Sowers and Cesspools.

To prevent this, purchase one of Taylor's Stench Traps and Garbage Baskets.

And promote the health, comfort and cleanliness of your family. [For description see Mining and Scientific Press, April 6, 1867.] Sold wholesale and retail by TAYLOR & SONS, at No. 429 Pacific street, San Francisco. 15v1411

THE CELEBRATED Self Generating Portable Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required.

Directions for Use. Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cap, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

Business of the Patent Office.

The issue of patents for the week ending May 28, embraces 289 new inventions, 11 re-issues and 2 designs, making a total of 302. This is by far the largest number ever issued for a single week, though not the largest issued on one day. The total issue of January 1, 1867, was 360, but that was for two weeks preceding that date.

A controversy has been going on for the past few weeks in the Department of the Interior, between the Commissioner of Patents and the Commissioner of Pensions, in reference to the rooms occupied by the clerks of their respective bureaus in the Patent Office. The difficulty seems to be thoroughly uncompromising in its character. Neither of them show any disposition to yield, and meanwhile the business of the Patent Office is falling behind to such an extent that it will require a very long time before it can be transacted within a reasonable time after its reception.

Secretary McClellan, who was then Secretary of the Interior, moved his office into the building in the spring of 1853, and was soon followed by the Indian Bureau, Land Office, Pension Office and Agricultural Department. It is not a little singular that the Secretary of the Interior does not interpose his authority to decide the vexed question. A portion of the Pension clerks are now occupying a separate building, and there is no good reason apparent why the rest of the bureau should not do likewise.

A NEW SCARECROW.—A member of the American Institute, suggests as the best scarecrow to keep birds from cherry trees, strawberry beds, etc., the stuffed skin of a cat, with big glass eyes. The position of the effigy should be changed every day, or the birds will find out that it is a dummy. As the material for its construction is plentiful, would it not be well for some of our gardens and orchards to try it, and report the result.

**AN OPEN FIELD FOR INVENTORS.**—Engineering, after speaking of inventions, closes its remarks by pointing out to inventors what is yet before them. It says:

Who can reflect upon the almost immeasurable forces of solar heat and lunar attraction exercised daily upon our planet, and with visible results, without hoping, and indeed to some extent believing, that human ingenuity will yet find means for penetrating nearer and yet nearer to these tremendous mysteries of nature, and turn them into new channels for the good of man? With countless millions of tons of hydrogen in the sea and of oxygen in the air, shall we not yet find means to burn the very waters of the globe, and literally set the river on fire? With millions of tons of carbon in the earth, shall we not yet convert it, by some means, into palatable and wholesome food? And shall we not yet find cheaper and readier means of converting the vast stores of vegetable fiber, with which nature abounds, into comely clothing, than by the present infinitesimal spinning and weaving of thousands of yards of yarn to form a single yard of cloth? That we may yet navigate the air is hardly less likely now than was the navigation of the sea by steam seventy years ago.

Future invention must give us cheaper food, cheaper clothing, and cheaper lodging. Past invention has not sufficiently secured these, and the condition of trade and of society is now such that the majority of the population, even when working almost continuously, can gain but a decent subsistence, without any practical advance upon their daily necessities.

The Engineer thinks that agriculture presents a wide field, especially for the chemist. It believes that the future must look for a highly scientific and artificial agriculture. The present capacity of the soil ought to be fully doubled by the aid of science and art.

**FLAME** is one of the most beautiful things in the world. Not a sunset sky in summer, not a blown tropic-flower, is more brilliant than flame; flame is the flower of fire. The ivy has no splendor like the mantling flame; it reddens like the thyrsus of the god.

**COAL**—A company has been formed in Santa Cruz for the purpose of prospecting for coal on the San Lorenzo, where there are said to be indications that it exists.

**Quartz Mill Construction and Superintendence**

THE UNDERSIGNED IS AT PRESENT OPEN FOR engagement as a working Superintendent in the construction or operation of a quartz Mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address, E. M. SHAW, San Francisco, care Mining and Scientific Press. 59v143m

**CUT NAILS.**

SAN FRANCISCO. 19v143m

**To the Mining Community.**

THE UNDERSIGNED, WHO HAS HAD THIRTY YEARS constant practice in superintending mines, is now prepared to inspect and report on Mines and Mining Properties, and advise as to the management of the same. Office, 851 Harrison street, San Francisco. **WILLIAM WILLIAMS,** Practical Mining Engineer. 16v14qr

**Notice to Miners, Well-Borers and Water Companies.**

**M. PRAG** IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Miscellaneous Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done. 8v13-1y Stove Store, No. 125 Clay street, below Davis.

**Pratt's Abolition Oil.**

FOR ABOLISHING PAIN—THE BEST REMEDY IN existence for Rheumatism, Neuralgia, Paralysis, Headache, Toothache, Sore Throat, Diphtheria, Weak, Swollen and Stiff Joints, Contracted Cords and Muscles, Cramps, Colic, Diarrhoea, Cholera, Pains in the Breast, Lane Back, and all aches and pains. It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 50 cents and \$1 per bottle. For sale by all dealers in medicines. Sole Proprietors, A. McBOYLE & CO., Druggists and Chemists, 554 Sacramento street, opposite What Cheer House, San Francisco. 16v14qr

**GOVERNMENT HOUSE,**

Corner of Sansome and Washington sts.

SAN FRANCISCO, CAL.

THE STREET CARS PASS THIS HOUSE IN every direction, every ten minutes.

The rooms of the House are well furnished, large and airy, and are let by the month, week or day, and are kept in superb order. There is a Restaurant attached for ladies and families, where persons can board for one-half the regular rate. 16v12-6m

SANBORN & CO

**HINKLE & CAPP'S CENTRIFUGAL ORE GRINDER AND AMALGAMATOR.**

Patent dated April 10th, 1867.

For Grinding and Amalgamating Charges of Ore.

Arranged as shown in the first engraving, the pan is adapted for grinding and amalgamating separate charges of ore of 800 lbs. each, doing its work rapidly, thoroughly and effectually.

This sectional engraving exhibits more clearly the arrangement and shape of the grinding parts of the machine. It, and the other engravings, will be more clearly understood by reference to the accompanying explanation.

Half Section or Top View.

**The Centrifugal Ore Grinder.**

This new GRINDER and AMALGAMATOR is extremely simple and compact in its construction. The principle availed of is entirely novel. The grinding is effected by perpendicular mullers, pressed laterally by centrifugal force against perpendicular iron dies, fitted to the inner sides of the pan. It is to be run at a speed of from 60 to 80 revolutions per minute, according to the hardness of the rock to be crushed. The pressure upon every part of the grinding surfaces is direct and uniform, and they wear with straight and true faces from first to last, conforming also to the shape of the sides of the pan, so that the work performed with old mullers and plates is as thorough and perfect as with new ones. The pulp enters readily between the mullers and side dies, the pressure being light in front and heaviest at the heel of the muller, there is no strain upon any of the parts, and no liability to breakage or disarrangement, and no wear except that which is useful on the grinding surfaces. The work done is performed without jarring, jerking, straining or clogging, with extreme regularity and evenness, the pulp being of great and uniform fineness. It is not liable to be clogged, nor to be obstructed, stopped, impeded or broken, by coarse pieces of rock, pick points or iron, accidentally introduced with the crushed ore, as these can readily pass each muller separately, without interfering with or affecting the other mullers, each of which is independent, or can rest upon the bottom below the mullers, without inconveniences, as the arms play freely a inch above the bottom of the pan. It is more readily cleaned up than any other pan, as each muller can be lifted out separately by hand, and there is no necessity for lifting the revolving cone or driver, which is also easily turned, there being no friction when not in use, or rapid revolution. The bulk of the mercury is not ground up with the rock, but lies below the lower ends of the mullers in a groove, and in another groove on the cover of the pan, where all the pulp and metal passes continually over it without cutting or carrying it away. The mullers and side

For Grinding and Discharging Continuously.

Arranged as shown in the second engraving, all the interior grinding parts being the same as shown in first view, this pan is adapted for receiving and grinding and discharging continuously crushed quartz as fast as supplied by a five-stamp battery, with No. 4 or 6 screens. A "sluicer," or some similar contrivance, to carry off the clay, slime and surplus water, is to be placed between it and the battery.

**EXPLANATION.**—E, muller-hanger; F, muller plate or shoe; G, side dies; I, supporting lip; D, bearing surface; J, feeder; X, weight to counter-balance wear of muller plates, or shoes; U, cover used in working charges of ore. The dark shade on the bottom of the pan represents one of the grooves for mercury.

dies are easily removed at any time, or when worn out, and an extra set of mullers is furnished with each pan sold. It is also adapted for grinding cement, sulphurets, roasted ores, etc. We claim all these advantages for our Pan, and that it will do more and better work, with less power, and less attention and manual labor, more rapidly and with less expense, than any other pan or muller made for the same purposes, and claimed to be of equal or greater capacity. We will sell them for use on condition that if, when fairly tried they fail to answer these promises, they may be returned. For full description and illustration, see Mining and Scientific Press, June 15, 1867.

**Hinkle & Capp's Centrifugal Ore Grinder and Amalgamator**

May be seen in operation, and examined, at the European Metallurgical Works, on Bryant, between Third and Fourth streets, San Francisco, where all interested in mining and milling operations are invited to inspect it. Its weight, as arranged for continuous grinding and discharge, with extra set of six mullers, is about 2,700 lbs.; or as arranged for grinding and amalgamating single charges of 800 lbs. of ore, also with extra set of mullers, about 3,000 lbs. Price, as above, completely fitted and ready for use, either way, \$300, gold coin.

For further particulars, apply by letter to **PHILIP HINKLE and CHARLES S. CAPP**, No. 513 Clay street, below Montgomery, San Francisco, Cal. or personally to the above, or **S. P. KIMBALL**, Esq. at the European Metallurgical Works, on Bryant street, between Third and Fourth streets, or at the Miners' Foundry, First street, near Folsom, where they are manufactured. Send for Circulars.

**PHILIP HINKLE and CHARLES S. CAPP**, Patentees, 513 Clay street, San Francisco. 25v14-1f

**First Class Mill,** In all respects, with Pans and Separators complete. The Mill is adapted for 20 or 40 Stamps. Full particulars may be had by calling on Messrs. Palmer, Knox & Co., Golden State Foundry, or **J. B. HITCHCOCK,** Millwright, Russ House. 19v14-3m

**DUDGEON'S PATENT Hydraulic Lifting Jacks —AND— OILER PUNCHES,** 16v14 Eighth street, cor. Minna. qr

**COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, AND ECONOMY, with the Minimum of weight and price.** These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction, account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the horrible principle is the pioneer's friend, and enables him to draw engines on their own wheels, to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world. All sizes on hand from 3 to 30 horse power, with and without carriages. Also, Portable Saw and Grist Mills. For sale by **TREADWELL & CO.,** Corner of Front and Market streets. 9v14-5m16p

New Books.

THE CALIFORNIA DIGEST OF MASONIC LAW, containing the Old Charges and Regulations of 1720; the Constitution and General Regulations of the Grand Lodge of California, as amended to 1866, etc., etc. Collated by Lorenzo G. Yates, Deputy Grand Lecturer, etc.

This work makes up a volume of 236 pages, neatly printed upon beautiful paper. In addition to the subject matter given in the title page, the work also contains the Constitution of the Grand Chapter; Rules of Order of the Grand Chapter; List of Subordinate Chapters; List of Past Grand Officers; Constitution of Grand Council; List of Subordinate Councils; Statutes and Rules of Order of Grand Commandery; Subordinate Commanders and List of Past Grand Officers of Grand Commanderies; Digest of Decisions of Grand Masters, etc., etc. The Grand Master, Gilbert B. Claiborne, whose opinion of such a work ought to be conclusive as to its merits, in a note to the collator speaks of it as follows: "I have cursorily examined the MS. of Bro. L. G. Yates' Digest of the Jurisprudence of Masonry in this Jurisdiction, under the Constitution of 1859, and have no doubt it will prove useful and valuable to the members of the Fraternity, as a book of reference. If he concludes to publish it, he will please send five copies to my address." For sale by D. Appleton & Co., of this city.

BEAN'S HISTORY AND DIRECTORY OF NEVADA COUNTY, CALIFORNIA: Containing a complete history of the county, with sketches of the various towns and mining camps, the names and occupation of residents; also, full statistics of mining and all other industrial resources. Compiled by Edwin F. Bean, Nevada. Printed at the Daily Gazette Office.

The above comprises a volume of over 400 pages, and forms the most thorough and complete digest of the kind which has yet appeared of any mountain county in the State. The work has been prepared with great care, and the typography of the book is highly creditable. The historical sketch of the county, comprising also its natural history, mineral productions, etc., is very full. Separate historical sketches, with directories, are given for each township. Professor Silliman has furnished an able and interesting paper on the mineral district of Grass Valley. Nevada county has long been recognized as the leading and most important mining county in the State; while the fact has more recently been developed that, in addition to its thousands of ledges of gold-bearing quartz and immense area of placer deposits, it also produces a soil on which can be raised, in the greatest perfection, all the productions of the temperate zone, while for its adaptability for the production of the grape it may rival even the famed vineyards of France and Hungary. Hence it is well that the interesting details brought together in this volume should be thus placed upon permanent record for present and future reference. Hudson & McCarty are agents for the sale of the book in this city.

Excelsior Double-Acting Suction and Force Pump.  
The Best for Mining, Farming and Domestic Use.

Hooper's Patent, Aug. 15, 1865.  
THE EXCELSIOR PUMP is a California invention of intrinsic merit, and as such is being rapidly introduced, and giving perfect satisfaction. At the Mechanics' Institute Fair (1865), it was awarded, for its superiority, a Premium Medal.

It is manufactured by California Mechanics, in the most perfect and durable manner.

It is remarkably simple in construction, and its valve chest is almost instantly accessible without disconnecting the air-chamber, suction or discharge-pipes. It can be worked at any speed.

Figure 1 is a sectional view of a 6-inch Mining Pump, showing the plunger and hump-packing; and the valve-chest containing the puppet valves. Fig. 2 illustrates the water-passages and valve seats in the chest.

The following sizes are constantly manufactured of this

SUPERIOR DEEP-WELL PUMP.

- No. 1—Cylinder 2½ inches; stroke, 6 inches; capacity 750 gallons per hour; weight, 60 pounds.
- No. 2—Cylinder, 3 inches; stroke, 7 inches; capacity 1,250 gallons per hour; weight, 80 pounds.
- No. 3—Cylinder, 4 inches; stroke, 9 and 8 inches; capacity, 2,500 gallons per hour; weight, 200 pounds; with iron frame and slide complete.
- No. 4—Cylinder, 5 inches; stroke, 15 inches; capacity 5,420 gallons per hour; weight, 530 pounds.
- No. 5—Cylinder, 6 inches; stroke, 24 inches; capacity 12,575 gallons per hour; weight, 1,000 pounds.

Nos. 3, 4 and 5 are made to endure the severe test of use in mines, and are constantly superseding those of other manufacturers. The pistons being packed with hemp, are proved to be far more durable and less expensive than leather.

We manufacture to order 8 and 10-inch Pumps. Also, sell at cheap rates, 5 and 6-inch Brass Pumps for ships.

See illustration of the Valve of this Pump, and further description, in another part of this paper.

For Circulars, or further particulars, inquire of or address J. W. BRITTON & CO., Agents, 120 Front street, San Francisco; H. J. BOOTH & CO., Union Iron Works, First street, or lam CUSHING & CO., Prop'rs, San Francisco.

THIS COMPANY ARE NOW PREPARED TO FURNISH Sulphuric, Nitric and Muriatic Acids of superior quality, in quantities to suit.

Orders will be received at the office on'y for Chemicals of every description, which will be manufactured as may be required. The Company beg to say that they have the advantages of all improved machinery and apparatus for the manufacture and manipulation of these products, and our Laboratory is fitted up with the most recent improvements which experience and science suggest, and is surpassed by none in completeness and perfection for the purposes it is designed. 9v14 3m

MECHANICS' INSTITUTE.

Resources of California.

THE MECHANICS' INSTITUTE of San Francisco, here-by offer a PREMIUM OF ONE THOUSAND (\$1,000) DOLLARS for the best Essay on the "RESOURCES OF CALIFORNIA, AND BEST METHOD OF DEVELOPING THE SAME," under the following conditions: One-half of the premium in cash on the certified award of the Committee of Judges, and the balance from the first proceeds of sales of the successful work, which is to belong to, and will be published by, the Institute.

The Essays are to be handed in to the Librarian of the Institute on or before the FIRST DAY OF JUNE, 1868, and the award will be made by the Judges at the opening of the Industrial Exhibition, which is to be held in August or September following. The Essay should be divided into three great heads, viz.: Mineral, Agricultural and Industrial Resources, with proper subdivisions of each subject. It should be sufficient in quantity to form a duodecimo (12mo) volume of from 250 to 300 pages long primer type, solid.

Writers will sign their articles in cypher, and send their names and address in sealed envelopes, which will be kept in a secure place by the Institute, and only be opened when the award is made. The manuscripts of unsuccessful writers will be returned to them without publicity.

The Committee of Judges have the right to reject all Essays in case they do not consider them worthy of publication or the premium. No further instructions than are contained in this advertisement will be given to this Committee, nor will they be subjected to any advice from the officers or members of the Institute in regard to their proposed action. All manuscript submitted must be in clear, legible writing, so as to admit of easy reading.

The following named gentlemen, who have been selected for their well known ability, public spirit and integrity of purpose, will compose the Committee of Judges:  
Hon. Fred'k F. Low, Maj. Gen. H. W. Halleck, U. S. A.,  
Prof. J. D. Whitney, S. A.,  
James Otis, Prof. W. B. Ewer,  
Wm. Overmuer Morris, E. N. Bugbey,  
By order of the Board of Directors.

the fire-box, and receives the water from the side pipes in which it is injected by the feed pump. By being so situated, it becomes partially heated before it enters the

section; *a, a* are the vertical pipes forming the side wall, and at *b* is seen the inner pipes; *d* is the transverso pipe below the furnace-grate. At *c, c* are shown two upright or vertical pipes, branching off at a right angle from the pipe, *d*, and having free communication with it. In the next section of the series of *b* there is but one vertical pipe, *e*, and it also freely communicates with the arched side pipes, *a*, of Fig. 2. These pipes are composed of an outer and inner pipe, similar to the side pipes, the inner one extending down to the fire-grate. Thus each pipe in the combined series presents within it a thin film of water to the immediate action of the heat, and as it evaporates is fed with water of a lower temperature from the inner pipe, which by its outer surface forms the inner wall of the water-film. The fire, passing over the top of the fire-wall at the back side of the furnace, completely encircles the series of pipes beyond the furnace, and also freely acts upon the arch where they are joined together; it then passes underneath the horizontal partition seen in Fig. 1, about midway between the top and

boiler in the alternate ordershown in Fig. 3. There is another advantage in this form of boiler that will readily present itself. Suppose a manufacturer wishes to extend the limit of the steam-producing capacity of his boiler. All that is necessary then is to remove the wall at the back end of the boiler and add as many sections as he chooses, as each section of the horizontal pipe, *d*, and the vertical one, *a* (Fig. 2), are cast together in one piece; and to extend the length of a boiler, all that is necessary is to unite a sufficient number of these sections by bolting them together in proper order by the flanges seen in Fig. 3.

It will also be observed that the horizontal pipes, *d, d*, are below the fire-grate, and consequently contain water of a low degree of temperature. Therefore all sediment, as it collects in the vertical tubes, falls into the horizontal tubes and into the colder stratum of water, and there quietly remains, with no danger of burning on the surface, as in the old style of plate boilers. From these lower tubes where it collects it can be easily blown out by the engineer at any time, and no danger of sediment or incrustation detrimental to the surface of the boiler need be apprehended.

Each section of the pipes actually forms a boiler by itself, separate and distinct from the others, yet having free communication with them at both top and bottom—the entire series receiving water from the same source and evaporating steam into the same steam-space. The immense amount of fire surface secured by this mode of construction, and the small body of water required to be present, must enable it to generate steam very rapidly, and at a comparatively small expenditure of fuel. A patent was granted to Mr. Jos. A. Miller, C.E., of New York, Jan. 8, 1867.

## An Improved Tubular Steam Boiler.

We give herewith a full illustration of a novel and an apparently improved construction for a tubular steam boiler. The steam capacity of all boilers depends upon the amount of surface exposed to the fire; and all improvements tend mainly to an increase of that surface. It is also well understood that the thinner the sheet of water is which is exposed to the action of heat, the more rapid will be the production of steam. It has been the aim of the inventor of the boiler herewith illustrated to combine, as far as possible, both these advantages. How well he has done his work, we leave for the reader to judge after perusing the following description, which we clip from the *New York Artisan* of January 16, 1867:

Fig. 1 is a perspective view, broken away at intervals so as to show the arrangement of the pipes or tubes of which it is wholly composed. A series of vertical pipes, which may be of cast iron or other material, are arranged in two parallel lines on each side of the fire chamber, and also extending back from the fire wall at any desired distance, according to the amount of steam to be produced. These pipes are joined at their upper ends, and in form are similar to a gothic arch. In Fig. 2 is seen a transverse section, in which *a, a* represents the arched row of vertical pipes, connected at the top and also connected at the bottom by horizontal transverse pipes, *d*. At *b* is seen an inner pipe fitted into *a*, which extends down to a level with the grate upon which the heat is generated. It will be seen that by this arrangement a thin film of water is thus presented to the action of the fire, which is almost instantaneously converted into steam, and ascending, it fills the steam space and the horizontal tube at the top of the arched series of pipes. From this pipe it may be conducted to whatever place it may be needed to perform its labor. The volume of water in the space, *b*, is of a colder temperature, and supplies the film presented to the fire with the necessary amount to take the place of that evaporated. The transverse pipe, *d*, is placed below the grate of

MILLER'S PATENT AMERICAN STEAM BOILER.

vertical side pipes. At *c, c* and *e*, we see other vertical pipes or tubes that have free communication with the transverse bottom pipes, and also communication with the vertical side pipe at or near the place where they join at the apex of the arch. At Fig. 3, this arrangement is shown in a horizontal

bottom of the pipes, and still further heats them, and is then conducted under the series of horizontal pipes, *d* (Fig. 2), and is then carried into the flue or chimney. The series of vertical pipes, *c, c* and *e*, etc., are commenced immediately behind the fire-wall, and continue the entire length of the

lence. This circumstance is not of itself dangerous, but if there be an excess of gas in the mine, and at the same time, from accident or carelessness, a means of ignition, then, indeed, the consequences are very likely to be serious. Hence the barometer becomes the miner's safest guide.

## NEW MODE OF DETECTING FIRE-DAMP, ETC., IN MINES.—Mr. J. Rofe writes to the Geological Magazine, and shows that miners have only to watch the barometer, and provide in accordance with its indications, for the supply of air to the mines in case of fire-damp, etc. Alluding to the well known "Blowing-well" of Preston, in Lancashire, England, he states that some time since, in a well recently constructed by him as a cesspool to some chemical works, he observed the phenomena characterizing the blowing-well! When the atmospheric pressure diminished, the air came from the well, loaded to a disagreeable extent with the offensive vapor of the cesspool. On continuing his observations with a barometer, he found similar results. He concludes from these facts that a coal mine must be regarded as a gigantic well, from which, when the atmospheric pressure diminishes, the air expands, and rushes out with great violence. This circumstance is not of itself dangerous, but if there be an excess of gas in the mine, and at the same time, from accident or carelessness, a means of ignition, then, indeed, the consequences are very likely to be serious. Hence the barometer becomes the miner's safest guide.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

## The Reese River Country and its Mines.

BY A. J. HOWK.

[Continued from Page 2.]

## HOT CREEK.

Our road crosses these hills through Eagle Pass, and four miles further brings us to the head of Hot creek. Here we find a broad pass running through the high mountain range on the level of the valleys that lie on either side, with what little descent there is to the east. Shortly after entering the Pass, we reach the scalding hot springs or pools which break out at intervals along its course, emitting steam and sulphurous vapor. Its borders are fringed with jointed, reed-like rushes, growing to the height of ten or twelve feet, which, with their varied hues of many delicate tints and clouds of steam rising here and there above their waving tops, present a novel and grateful sight to the weary eye long accustomed to rest on monotonous stretches of dry, sage-covered plains or parallel mountains, everywhere, over hundreds of miles, producing the same vegetation, and differing only in their rock formation, which is ever changing from the regular but up-tilted strata of slate, granite, syenite and marble, to the chaos of indescribable volcanic rocks of scoria and trachyte. About two and a half miles after entering the Pass brings us to one of the mammoth quartz lodes of this region, known as the Indian Jim. This immense lode rises to a great height on the north or left hand side of the cañon, going east. It is full 200 feet wide, with occasional pockets of extremely rich ore. The lode is not of pure quartz, but appears to be mixed with vast quantities of the enclosing or country rock, fallen into the seething mass of the quartz from the sides as it was forced up from below, filling the vast fissure with a conglomerate of quartz, limestone and slate. On the south side of the cañon is situated the Merrimac and Norfolk lodes, supposed to be identical with the Indian Jim. Five or six miles further, at the eastern entrance to the Pass, we find the town site of Hot Creek, in

## HOT CREEK MINING DISTRICT.

This is about lat. 38° 30', forty-five miles E.N.E. of Belmont and one hundred miles S.E. from Austin, via Smoky Valley and Charnock's Pass. The district was discovered in the spring of 1866 by the Robinson Brothers (the same mentioned in a former letter as the discoverers of Silver Peak). They were piloted here by a Shoshone Indian, called Jim, after whom the lode described above was named. From July to September following, this whole region swarmed with prospectors from the older districts on the west; a great number of lodes were discovered, producing at the surface the most fabulously rich silver ore heretofore found. Ore yielding from \$3,000 to \$12,000 per ton, and in some instances much higher, was not of unfrequent occurrence in small quantities; but, through want of capital, the lodes are yet undeveloped to the extent that will fully establish their permanency. As far as explored, horn silver or native chloride of silver, is the predominating ore at the surface. Probably the most massive deposits of this rare ore ever found in Nevada occur here (except, perhaps, the reported developments in the Combination Company's mine at Belmont). There are no mines in the immediate vicinity of the town, the site being selected for its facilities in the way of water and fuel. The latter is very abundant to the north of the Pass, which is properly in Morey District, the cañon or pass being the dividing line between the two. The larger number of mines are located six

miles south, near the head and on either side of Rattlesnake Cañon.

The whole surface of the country in that vicinity appears to be of limestone; but it is evidently only a capping, overlying granite, as in one instance, at the Oro mine, the granite is forced up with the lode. Among the most noted mines are the Keystone, Gazelle, Indian Hunter, Oro and Old Dominion. On the former two, extensive developments are in progress, under the management of Mr. O. A. Gager, of the Parrot mill. In the early part of the past winter, a small, inefficient mill was erected in this district by the Combination Company, for the purpose of prospecting the oro, and I understand larger works will take its place during the coming summer. This company is ably represented by Mr. Gould, as superintendent, who may be called the pioneer in milling in what is known as the lower country or the region lying between Silver Bend and Pahranaगत. This section is not as well supplied with timber as that on the north and south, but affords sufficient fuel for many years, until the shrill whistle of the locomotive and the rolling thunders of cars reach through all these valleys and mountain passes, bringing fuel to the mines and carrying ore to the exhaustless timbered slopes of the Sierra Nevada.

We are now in the very core of the richest silver region ever discovered, before which the history of the once famous mines of South America and Mexico sink in insignificance. He would indeed be a credulous man who, on a thorough examination of the "Great Southeast" of Nevada, would longer doubt the truth of the prediction or promise of Bishop Simpson. I am not speaking of Hot Creek especially, but of all the surrounding country.

[Written for the Mining and Scientific Press.]

## Quicksilver Mining in Monterey County.

NEW IDRIA Q. S. MINE,  
Fresno County, July 1, 1867.

MESSEURS. EDITORS:—Some few days ago, while crossing the adjacent mountains surrounding the New Idria quicksilver mine, I came abruptly upon a few nicely built miners' cabins, near by a beautiful and never-failing stream of water, known by the very appropriate name of "Clear Creek." In those cabins are living the employés of Monterey Quicksilver Mining Company, which has just commenced operations on one of their locations, called the Clear Creek mine. Here, by a well executed tunnel, they have penetrated into the mountain nearly 300 feet—gaining, I should suppose from observation, a perpendicular height of 150 feet. The tunnel was commenced about fifteen feet above the bed of the creek, in magnesian earth, intermingled with lime and other mineral substances, demanding no special remark, except, perhaps, to correct the erroneous idea that magnesia forms the base of all the ledges in this vicinity.

At the end of sixty feet drifting in the above tunnel, the parties came unexpectedly against a face of hard rock, which proved to be a channel of black slate, similar in character to the rock found in the Idria mine, running nearly east and west, dipping north about 3½ feet in six feet, and traversed by fissures or cracks, and in places faintly painted with vermilion. The next channel intersected was a kind of soapstone, similar to what is termed the bedrock of the New Almaden ledge; but quicksilver ledges carry no regular bedrock—neither was there ever a well-defined ledge of cinnabar known to exist. The so-called ledges are channels of mineral ground, running in a certain direction, traversed by other channels of rock-bearing mineral indications, and on either side deposits of cinnabar are promiscuously found. I have seen this statement verified in the Old Almaden in Spain, the New Almaden, and every other quicksilver mine in California, and no doubt such is the character of quicksilver ledges throughout the mining world.

This channel of soapstone at the Clear Creek mine, presents a somewhat peculiar appearance, having passed through numerous well-defined branches of calcareous spar, all dipping north at an angle of forty-five degrees, or thereabouts. When I visited

the mine the parties had just intersected the mineral channel—quite different in character from anything yet passed through in said tunnel. This mineral channel, or so-called ledge, also dips north, and shows every indication of the probability of discovering large deposits of metal. The appearance of the ledge, at this depth of 150 feet, is truly encouraging. There are three other locations belonging to this company, viz: The Boston, Andy Johnson, and Fourth of July. Assays have been made from each of these locations, showing gold from \$13 to \$55 per ton of rock, and from 7½ to 33 per cent. of quicksilver.

The accuracy of this statement cannot reasonably be doubted, as particles of gold have been found in the refuse taken from the New Almaden furnaces. Omitting the existence of gold, and taking into consideration the almost inexhaustible amount of cinnabar bearing rock at command, the percentage for quicksilver alone must be very encouraging indeed, and warrants a determined and vigorous prosecution of the company's mines.

CAPTAIN FAULL.

## Facts About Patent Matters.

NUMBER FIVE.

## THE EXAMINATION, APPEAL, ETC.

Having got your case ready, the next step is to send it to the office, directed to the Commissioner of Patents. When the case reaches the office, it is examined by the Chief Clerk, who receives and opens all mail matter, or cases handed in. He makes a memoranda of the money and papers received, then sends the letter to another room, when the case is made up, by placing the papers in a kind of envelope, called a file, on which is endorsed the name and residence of the applicant, name of the invention, date of reception of the fee, drawings, specification and model—the latter, in the meantime, having been sent to another room where it is labelled with the name of the invention, and date of its reception, and where it is retained until sent for by the examiner. The file is then sent to the draughtsman's room, where the case is entered on a record book, after which, with other cases belonging to the same class, it is sent to the room of the examiner in charge of the class to which it belongs. This classification is quite extensive, but some idea of it may be obtained by naming a few, as for instance, one class embraces all agricultural implements and processes—another, mills of all kinds—another, all machines for working wood—another, all steam engines, etc.—another, civil engineering, etc.

The examiner takes up the case in its order, sends for the model, and examines the drawings to see that they are exact duplicates and correct in all other respects. He then examines the specification in connection with the drawings and the model, to see if the invention and all its parts and their operation is fully and correctly described. If there is any error in either of these, in any particular, he returns it to the applicant, or his agent, if he has one, with a letter pointing out the defect, in order that it may be corrected, which letter (and all others relating to the business of the office) is signed by the Commissioner. When the applicant receives his papers, he proceeds to make the correction, by writing out the necessary amendments on a separate sheet, indicating the line and page where it is to be inserted, and what, if any, of the original, is to be erased, and returns them together with the original papers, *unaltered in any respect*, to the office. They are then sent again to the examiner, who enters the amendments, indicating their proper places by directions in red ink, and if all right, it is then ready for examination; if not correct, it is again returned with another letter, and so on until it is right.

The papers having thus been made all right, and the examiner having become familiar with the peculiar features of the applicant's device, proceeds to make the examination. To facilitate this duty, all the drawings of patented articles are placed in large folios, arranged in classes, and placed in cases in a very large apartment called the draughtsman's room. Of these there are about 40,000, [now 52,000.] The drawings of all rejected cases are similarly arranged in another large room. Proceeding to the class to which the invention belongs, he draws forth one of the folios, and carefully examines every drawing in it and so on through all the class, to see that the same has not before been patented. If the same or a similar device is not found there, he then goes through the same class in the rejected cases in the same manner; and if not found there, and it is of a character or class in which anything has been done abroad, he proceeds to the library, and there examines the various foreign reports of in-

ventions and other works to see that the same thing has not been patented or described abroad.

Each examiner's room is also provided with a variety of publications relating to the class in charge there—in some cases forming of themselves quite large libraries—and they too, are to be examined. If in none of these places, anything containing the features claimed by the applicant can be found, it only remains for the examiner to look over the caveats on file, (and which occupy large cases in still another room,) to see that no one has filed a caveat for the same invention, and then it is ready to pass for issue.

But it frequently happens that in one or the other of these places, the same device will be found. In that case, a letter is written, rejecting the application, and giving the name and date of the prior inventor, either patented or rejected, or naming the publication and page where it is described. If the applicant, after examining the references thus given, is not satisfied, he has the right to ask a re-examination, after filing such reasons as he may desire, pointing out the difference which he may believe to exist between his invention and those given as references, or, if possible, he may so amend his case, by striking out the claims to those features shown in the references, so as to avoid them, and still obtain a patent on others. If a second time rejected by the examiner, he may thereafter appeal to the Board of Examiners-in-chief; and from them to the Commissioner in person—then to the United States Court for the District of Columbia, and finally to the Supreme Court. *The papers, however, must not be altered or amended after leaving the Examiner's room.* All subsequent action is simply an appeal to a higher tribunal, which is to decide upon the case as finally passed upon by the examiner, simply affirming or reversing his decision, or that of the previous tribunal, whichever that may be. The party is, however, at liberty to file such argument at each successive step as he may see fit. No additional fee is required on appeal to the board, but at each subsequent step.

[To be continued.]

MENHADEN OIL.—The manufacture of menhaden oil has become, of late, quite an extensive and important branch of business in New England. These fish are caught in great numbers, and at frequent intervals, all along the coast from New York city to the eastern part of the coast of Maine. They were formerly caught in part for food—being cured like mackerel—but chiefly for manure. The recently enhanced value of animal oils has now made them more valuable for their oil; while the residue, after treatment for oil, still possesses considerable value for manure. They were formerly taken altogether in seines upon the seashore; but latterly they appear to be caught at sea. Some twenty vessels are annually fitted out for this purpose, from different ports in the State of Maine; having furnaces and presses for doing all the work of expressing the oil on shipboard. In addition to these vessels, there is scarcely a town on the coast of Maine, below the mouth of the Kennebec, where more or less of this oil is not manufactured. There is an establishment of the kind near Bristol, R. I., operated with a capital of \$40,000. A number of others, of less extent, are operated in the same town.

BREAKING CASTINGS.—The *Scientific American*, in answer to a correspondent, suggests the following method of breaking up large castings: Drill a few holes of three-quarters or one inch diameter from six to ten inches deep, filling them nearly to the top with water, and then insert carefully fitted steel plugs to rest on the top of the water. A blow from a heavy drop will probably do the business. In your case the mass of iron is three feet square; perhaps inch holes, drilled ten inches deep, and filled to within two inches of the top, would be effective. The steel plug should be about four inches long and fit as nearly water tight as possible.

HONEY BEES.—Notwithstanding the difficulty of keeping honey bees, in their domestic state, in California, they appear to thrive remarkably well when left to themselves. The mountains are becoming full of them, and bee-hunting has become a profitable business. California will soon literally become a land "flowing with milk and honey."

## Mechanical.

**CUTTING GLASS UNDER WATER WITH SHEARS.**—The London *Photographic News* gives the following hints and instructions relative to a mode of cutting glass with a common pair of scissors, which may not be known to the majority of our readers, and in places where glazier's diamonds are not accessible, the process may be of some value. It requires a little patience and some dexterity to thus cut glass to a given line with a smooth edge, yet it can be done under water after a few careful trials. To mechanics and others who often have occasion to cut glass into peculiar shapes, it may be worth while to remember this simple application. The operation is detailed as follows:

In order to insure success, two points must be attended to; first and most important, the glass must be quite level while the scissors are applied; and second, it is better to begin the cutting by taking off small pieces at the corners and along the edges, and so reduce the shape gradually to that required, for if any attempt is made to cut the glass all at once to the shape, as we should cut a piece of cardboard, it will most likely break just where it is not wanted. Some kinds of glass cut much better than others; the softer glasses cut best. The scissors need not be at all sharp, as their action does not depend much upon the state of the edge presented to the glass. When the operation goes on well; the glass breaks away from the scissors in small pieces in a straight line with the blades. This method has often proved very useful in cutting ovals, etc., which would be very expensive if ground out; and though the edges are not so smooth as may be desired for some purposes, the method is worth knowing.

**NEW USES FOR MICA.**—Pischer, of Nuremberg, lately suggested the use of mica for various decorative purposes. For one such application, the thin plates are first purified by treatment with strong sulphuric acid, and then silvered by the ordinary process adopted with looking glass. The mica thus acquires a beautiful silver luster, and it may easily be cut into any shape to be used for inlaying work. The flexibility of the mica, will, of course, allow of its being applied to round surfaces. When a sheet of mica is heated to full redness for a time in a clay muffle, it loses most of its flexibility, and is changed considerably in appearance. Under reflected light it has a dead silver-white look, but viewed by transmitted light it is seen covered with grey spots. This latter appearance is lost when two or three pieces are superposed, and the transparency is lost. The mica after heating is also a beautiful material for inlaying work. It should be cut into the shapes required before it is heated. Another very pretty effect is obtained by scattering small fragments of mica on freshly-poured sheets of gelatine, and varnishing it with a dark-colored solution of gelatine. Finely ground mica on colored gelatine also shows very pretty effects; and the very finely-ground material mixed with a solution of gum-arabic may be used, Pischer says, for silver ink.—*Mech. Magazine.*

**CRYSTALLIZED BY CONCUSSION.**—A circumstance apparently confirmatory of the disputed theory of a molecular change in iron from mechanical shocks, is related by a correspondent at Underhill, Vt. He says that an old relic of the Revolution, a French gun barrel, which had been refitted with new stocks and locks several times, after standing fire perhaps the millionth time, burst, and in such a manner that every one who saw it pronounced it to have been originally a cast iron barrel, until an old iron maker convinced them by showing the weld on the under side. But the appearance otherwise was exactly like cast iron, and brittle at that. Mr. E. attributed the change in the iron to the action of the sulphur in the powder and its long use and many times repeated action.

**CEMENT.**—A cement particularly adapted for attaching the brass work to petroleum lamps, is made by Pischer, by boiling three parts resin with one of caustic soda and five of water. The composition is then mixed with half its weight of plaster of paris, and sets firmly in half to three-quarters of an hour. It is said to be of great adhesive power, not permeable to petroleum, a low conductor of heat, and but superficially attacked by hot water. Zinc white, white lead or precipitated chalk may be substituted for plaster, but hardens more slowly.

**PRESERVING LUMBER.**—Much attention is now being paid in the Eastern States to preparing lumber, so as to make it more durable than in its natural state. The importance of some process for preserving lumber, in its great variety of uses and exposure to the destructive action of moisture, heat, and imperfect ventilation, has long been recognized, and a successful and economical means to this end has been found in the process of "Burnettizing." That business is carried on in Bangor, Maine, on a very extensive scale. The material used is chloride of zinc, which, it is claimed, preserves wood from the adherence of animal and vegetable parasites, and from the attacks of insects; and also completely preserves it from wet and dry rot, besides rendering it unflammable when used of a certain requisite strength. Its effect on canvas, cordage, metals, etc., is said to be equally beneficial; and the claims of the proprietor of the Burnettizing Works are strengthened by testimonials from a vast number of ship builders, railroad men, manufacturers, etc.

**PAPER PIPES, CISTERNS AND PAILS.**—We have already alluded to the introduction of paper pipes for conducting water, and the advantages which they possess over those made of iron or lead. Large tanks and cisterns are now being made; also pails, etc. In making these articles, the paper, by a peculiar process, is laid in sheets over a mold. The same material is also being used for the manufacture of sugar molds. The pails made from it are said to outlast galvanized iron, and to withstand a very great degree of heat. They are not effected by acids or other corrosive substances, and are greatly in request on shipboard, and other places where severe usage is expected. The price is rather high, \$1.50 in currency at wholesale in New York; still it is thought their greater durability render them cheaper in the end than either wood or iron.

**STEEL WIRE.**—The use of steel wire has been greatly extended since it became known that a wire could be produced which combined the advantages of lightness with hardness and extreme tenacity. It is now employed not only in the manufacture of needles, fish-hooks, springs, music-springs, small tools, umbrella-frames, and crinolines, but also for ropes and cable. Steel wire rope is now very generally used in the mines, both of this country and Europe, where the light weight of the rope is of such importance both in respect to safety and economy; also on railway engines, and for drawing plows where stationary steam power is used for preparing the soil. Large quantities have been required during the last five years for submarine telegraphic cables. Steel wire ropes are also used on canals for towing purposes. Some idea of the quantity of steel wire used may be formed from the fact that one establishment in Great Britain has made during the last year more than 30,000 miles of one size, No. 13, equal in diameter to .005 of an inch.

**PRINTING ON GLASS.**—DeMothey, a Frenchman, has devised an ink and other preparations by which he is enabled to print on glass, by means of rollers, similar to those used in calico printing. After printing, the glass is subjected to heat, by which the picture is vitrified and permanently fixed in the glass. The colors are mixed with a silico-borate of potash and lead, as usual in painting in glass; the composition being rendered plastic by rosin and turpentine.

The largest hardware manufactory in the United States is located at New Haven, Conn. It employs 800 hands, and turns out 4,000 different kinds of articles, mostly Yankee notions. The annual value of its productions is estimated at from four to five millions of dollars.

**KYANIZING BY STEAM.**—It is said that while it costs about ninety cents each to kyanize railroad sleepers by steeping them in the liquid—the process usually employed—the same thing can be effected equally well by means of hot vapor, at an expense not exceeding ten cents.

A WHOLE WELDED ROLLER from Dusseldorf is exhibited at the Paris Exhibition by Prussia. A steam dome is welded upon the boiler, and so accurately and smoothly is the whole work done as to be hardly distinguishable, superficially, from a casting.

## Scientific Miscellany.

**MELTING WROUGHT IRON.**—Many people, even well informed iron men, have an idea that wrought iron cannot be melted—that it will granulate and burn up, or oxidize in the furnace, rather than fuse. Such, however, is not the case. Wrought iron may be melted and cast into molds, like ordinary cast iron, provided a sufficient degree of heat is applied. Cast iron is fused at a temperature of 3,000°; but wrought iron requires a degree of heat not less than 6,000° for fusion; even if we could readily produce the requisite degree of heat for melting wrought iron, where should we find the material sufficiently refractory to melt it in or retain it, as in a mold, while it was solidifying. It is more easily melted when subjected to great heat in the presence of carbon and manganese. In the process of the manufacture of the best kinds of steel, wrought iron is cut up into small fragments, weighing four or five ounces each, placed in a black lead crucible, with a little pulverized charcoal and black oxide of manganese. Thus prepared it is subjected to the requisite degree of heat, melted and run into ingots, which are rolled or hammered into the desired shapes.

Wrought iron is nearly a pure iron, and especially free from carbon; steel is a very pure cast iron—and like it, is a carburet of iron; hence it can readily be melted. Wrought iron can be melted only after it has been again re-charged with the carbon of which it has been deprived in the process of puddling, pressing, etc. For all practical purposes, therefore, wrought iron is infusible.

**DRYING BY SUPERHEATED STEAM.**—Steam, when heated above 212°, becomes more of an absorbent, and so increases as the heat is increased. A room containing superheated steam becomes a Turkish bath—that is, has a steam atmosphere, and, proportionally, so far as the air is concerned, becomes a vacuum. Fruit, lumber, etc., may be rapidly dried by this process. A fruit-drying apparatus of this description is sold in New York, from two or three dollars up to almost any price, according to size, etc. Lumber is dried by this process. It is simply placed on cars, and drawn slowly through a drying room, until thoroughly dried. The drying may be effected in a few hours. So powerful is the action that a four-inch scantling may be so thoroughly dried as to destroy the grain; yet, by proper management, no damage is done. The wood can be seasoned to any required extent. It is by far the best process for drying fruit. Fruit should be rapidly dried, as soon as ripe, and before its starch is converted into sugar. When so dried, it is much better in quality and appearance, and keeps much longer and better.

**FREEZING GLYCERINE.**—According to the statement of Dr. W. S. Squire, a mass of glycerine (not nitro-glycerine), on freezing, leaves a small portion of the liquid still in a fluid state; on carefully draining this from that portion which has been congealed, the latter is much lighter in color than when liquid. The solid portion is heavier than the remaining liquid, and sinks in it. The liquid drainings cannot be solidified, even when exposed to a great degree of artificial cold in the laboratory. At least Dr. Squire had not succeeded in congealing it; it was simply rendered a little more viscid. Even a journey from London to Edinburgh, giving it both percussion and intense cold, did not freeze it, or in any way induce crystallization.

**PLANTS BUT AIR.**—Modern chemistry teaches us that plants consist almost entirely of condensed gas, and return after death to their natural elements. The small amount of mineral matter which they contain is represented in the ashes which are left after combustion.

**DECOMPOSITION BY GASEOUS CURRENTS.**—M. Grenet, of France, has made the remarkable discovery that certain bodies are decomposed by the simple passage of a current of inert gas. For example, when a current of nitrogen, hydrogen, or common air, is sent through a solution of the carbonate of lime, of baryta, or of potash, carbonic acid is set free, while lime, or baryta or potash, is precipitated. The gases will disengage sulphuretted hydrogen from the sulphidates of the alkaline sulphides. In like manner sulphuric acid gas may be disengaged from sulphide solutions, and acetic acid from acetates. Oxides of nitrogen are eliminated from nitrates at a temperature much lower than the temperature of decomposition. These salts emit acid very slowly in the same atmosphere, and a rapid current is supposed to simply increase this tendency to dissociation.

**THE CHOLERA.**—The French Academy of Sciences recently offered a prize of \$20,000 for a satisfactory solution of the nature of and remedy for the Asiatic cholera. Several essays have been handed in, opened and examined; but no one has been considered worthy of the prize; although several have been thought to possess sufficient merit to entitle them to special awards, which have accordingly been declared. This learned body thereby express the opinion that neither the nature of the Asiatic cholera is well understood; nor has any reliable and scientific course of treatment yet been devised for its cure.

**RARE CELESTIAL PHENOMENA.**—A very interesting celestial phenomena will take place on the 21st of August next—once the like of which has occurred but twice before in the records of history. The planet Jupiter will on that day be seen unaccompanied by either of her satellites for the space of fully two hours. Of her four moons, three will be invisible, on account of their passing simultaneously over the planet's disk, while the fourth will, at the same time, be immersed in the shadow of the planet.

**HOW TO KEEP KEROSENE LAMPS CLEAN.**—Most people who use kerosene lamps have found great difficulty in keeping them clean. The oil seems to creep up by the wick and otherwise, and thus on and over the outside of the lamp. The *Scientific American* suggests, as a remedy, to smear the edges of the lamp where the oil comes over, with the white of an egg, gum-arabic or any other convenient substance which is repulsive to the oil.

**THE PROGRESS OF APPLIED SCIENCE.**—Industrial Exhibitions may be taken as the index of the extent of the practical application of scientific principles. The international Fair at the Crystal Palace, London, 1851, displayed the products of not quite 14,000 exhibitors. That at Paris in 1855 embraced 24,000 exhibitors. That at London in 1862 contained 29,000. At the present Exposition at Paris there are no less than 45,000 exhibitors.

**POWER OF THE SUN'S RAYS.**—A lens has recently been made for Mr. Parker, of London, three feet in diameter, three inches thick in the center, and weighing 212 pounds. In the focus of this powerful lens the most refractory metals are almost instantly fused and completely dissipated in vapor, while unyielding stony substances are as readily vitrified.

**CONVERSATION BY TELEGRAPH.**—A remarkable discovery is reported in Italy, by which it is claimed that two persons at a distance may converse by telegraph, so that they may recognize each other's voices. The *modus operandi* has not been made public, and for the lack of it the asserted invention is considered very doubtful.

WHEAT has been subjected to a temperature of 100 degrees below zero, and to a temperature of 210 degrees above zero, without destroying its germinating properties.

**COAL VS. WOOD.**—It is stated in the *N. Y. Gas-Light Journal*, that while a ton of coal yields but 11,000 feet of gas, a cord of wood has been made to yield 98,000 feet.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to Inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

RECENT INVENTIONS.

**DALTON'S IMPROVED HEADER.**—The Contra Costa Gazette says that Mr. H. N. Dalton, of Pacheco, has made what is generally conceded to be an important improvement upon the Haines' Grain Header. The improvement consists mainly in attaching the driving beam or pole, at a point near the wheel axles, in place of attaching it at the back of the frame. By application of the driving power at a point near the center, the machine is always better balanced, is under easier control in adjusting to any length of standing grain; it is turned with less strain upon the frame and steering wheel, will run with less wear and much lighter upon the team, and, more than all the rest, will perform its work easier and better, because the driving force is always exerted at so much smaller angle with the plane on which the knife is working than when this force is applied at the back of the frame—often at an angle of ten degrees or more. The first of the improved machines, which was put to work a few days since, is said to be answering all expectations in practical operation. A second one will follow it in a few days, and there seems little reason to doubt that Dalton's improvement will meet with merited favor, and eventually supersede the original Haines' arrangement entirely.

**INVENTION FOR FIRING FUSE.**—The Marysville Statesman of the 7th inst. says: "We saw yesterday, at the gun shop of Mr. P. George, on Second street, a very important and valuable improvement, in the shape of a patent for attaching and igniting fuse. The arrangement is a small brass needle after the style of a needle gun. A piston runs through the center, at the end of which is a percussion cap. To this piston is attached a small chain which works a spring. By affixing a string to this chain and pulling at it, the cap is made to explode. It will be readily seen that a person desiring to fire a blast can thus remove to any distance he pleases, simply by lengthening his string. Another important consideration is that very little fuse is required, a piece six inches long being sufficient for all purposes. The real value of this invention cannot be too highly prized, and its general use may be the means of saving many valuable lives."

**INGENIOUS.**—A Nevada county correspondent of the Times, speaking of Messrs. J. and A. E. Redstone, says: These gentlemen have invented and improved on everything, from a toothpick to a marine engine, and have received medals from the World's Fair and the different States in the Union for their improvements in machinery. Among the curiosities here are a steam boiler and engine, which can be carried readily by four men, and steam can be generated in six minutes. They are now having manufactured in Sacramento a log-sawing machine, of their invention, which will do in one day the work of twenty men.

**DEWEY'S HARVESTER.**—The Stockton Independent speaks as follows of a new harvester recently invented by Mr. Henry Dewey, which is at work at the Live Oaks, near Woodbridge: A gentleman who saw it in operation, says it cuts forty acres per day with six men and six horses, and the inventor thinks he could cut fifteen or twenty more if there were no stumps in the way! Fifty or sixty acres a day is pretty fast harvesting we should think. The inventor, Mr. Dewey, intends to secure a patent.

**WALTON'S TAMPING MACHINE.**—Mr. E. W. Walton, of Drytown, Amador county, Cal., whose invention for sharpening drills we noticed a few weeks since, has also another useful invention in that direction, which he calls a "tamping machine," which is designed to facilitate the splitting of wood by the use of powder. The apparatus may be described as a hollow auger, or drill, which, containing the charge and is inserted into the log to the depth required. The powder is then discharged by means of a cap, and expends its force on the interior of the log.

**FOR HEMORRHAGE.**—A Frenchman has invented a new paper which instantly stops the hemorrhage caused by wounds. Marshal Neil has passed a contract with him for 300,000 quires of this bibulous paper.

**MILK-WEED FIBER.**—An ingenious mechanic has discovered a process by which the enamel can be removed from the fiber of the milk-weed. The fiber then becomes

equal to cotton—soft, silky and of great strength. Cloth made from it is very strong. The value of milk-weed as a fiber, has long been recognized; but the difficulty hitherto has been to prepare it thoroughly and cheaply. Perhaps the above invention has accomplished the desired object.

PATENTS RECENTLY ISSUED.

65,538—FURNACE FOR DESULPHURIZING ORES.—William Bruckner, San Francisco, Cal.:

I claim the incline partition, D, in the form of a deviating square, or any other shape, placed at any inclination or angle to insure a constant passing around it of the material to be treated, said partition to be constructed of iron plates in sections or as a whole, and covered with fire-proof material, with surfaces flat or double concave, substantially as described and for the purposes set forth.

This invention is designed for an improvement on the revolving desulphurizing cylinder furnace, previously patented by Mr. Bruckner, and consists in the substitution for the spiral projectiles originally used, of a partition running through the center of the cylinder, dividing it into two equal parts. The partition has each end cut off, at an angle of about 45° with the direction of its side, giving it a rhomboidal shape. This partition is made to answer the purpose previously accomplished by the spiral projections, and by its use the ores are effectually stirred and mixed, so that every particle is repeatedly and successively brought into contact with the oxidizing flame, until the ores are thoroughly desulphurized.

65,628.—PAPER REEL FOR TELEGRAPHIC REGISTERS.—Lewis W. Worth, Sonoma, Cal.:

I claim the reels, B, C, adjustable drum, F, with ratchet, P, pawl, R, and spring, S, with cord, L, arm weight, W, for the purpose herein specified and set forth.

The object of this invention is to provide a more ready means, in connection with a telegraph register, for winding up the paper and keeping it from kinks, and also to enable the operator, by having the paper stretched before him, to more easily read it. It may be readily attached to any register in ordinary use.

65,750.—TEETH FOR LIFTING LODGED GRAIN.

William Marcus Jackson, Woodland, Cal.: I claim the elastic shoes in combination with the yielding fingers, applied to a frame or section to be attached to a reaper, and all arranged to operate in the manner substantially as and for the purpose set forth.

**SINGULAR DISCOVERY.**—The engineers of the new Blackfriars bridge in London, who have been compelled to excavate into the bed of the river, lower than engineers have ever gone before, have made a most unexpected and singular discovery of an immense deposit of bones fifteen or twenty feet below the bed of the Thames. In the gravel and near the clay were found the bones of the ox, the sheep, the horse, and a few human remains!

The Americans have secured for American steamboats the exclusive use of two of the principal rivers of China. Our English cousins appear to have failed in their efforts in that direction. Cause—the faulty construction of their boats for inland river traffic. Americans beat the world in that particular class of navigation. The English are striving to kick up a breeze in consequence of their being shut out from those rivers.

**THE BRITISH POSTAL SERVICE.**—The reports of the British Post Office for 1865 show a profit over and above expenses of \$7,400,000. The net revenue of the Department for 1856 was \$3,000,000. All the charges for ocean service are paid in full out of the postal results, notwithstanding the appropriations are made directly by act of Parliament.

**THE FOREST SPRINGS MILL,** near Grass Valley, will soon have four of Hendy's patent concentrators attached to the works.

BULLION PRODUCT OF THE LEADING CLAIMS ON THE COMSTOCK LODE.

We obtain the above valuable tables, showing the bullion yield of the Comstock Lode for the first six months of 1867 as compared with the same period in 1866, from the Commercial Herald and Market Review, a new paper, the first number of which was issued on the 10th inst. "The increase of the bullion yield of the Comstock Lode," says the same paper, "as observed in the above comparison, is very marked, showing the returns of twelve companies during the first half of 1867 to be \$2,317,946 31 more than during the same period in 1866. Making an allowance for the companies on the Comstock Lode whose names do not appear in the above table, and the prospective increase of those quoted, the probable yield of that Lode for the year 1867 will reach nearly \$20,000,000." We have been unable to obtain the yield of the Kentuck and Gold Hill Quartz M. & M. companies for the first six months of 1866. The Ophir mine produced no bullion during the first half of the present year.

Mining Share Market.

During the past week the mining share market has experienced a marked depression. There does not appear to be any well-founded cause for such a decline. The statement of the product of the mines, represented by these stocks as given above, gives evidence of permanence and increased future value.

**SAVAGO.**—Continues to be well maintained, opening at \$4,980, then selling at \$4,750, ex-dividend of \$300 paid on the 8th instant, rapidly advancing to \$5,000, and at the close \$4,900 is asked. The ore extracted during the week ending July 6th, amounted to 1,629 tons, the estimated value of which is stated to be \$66,440, equal to \$40 78 7/8 ton. Of this amount the north mine, on the seventh level, yielded 898 tons; the middle mine 347 tons, and south mine 281 tons. The short product of the week under review is accounted for by the intervention of the Fourth of July. We are informed that the northwest end of the seventh level, at winze No. 1, is an excellent ore, yielding most of the first class ore now obtained from the mine. The other portions of the claim continue to look as well as formerly. The actual bullion returns in June aggregated \$370,493 96, leaving a cash balance of \$70,000 in the treasury after discharging the dividend, amounting to \$240,000.

**HALE AND NORCROSS.**—No sales; quotable at close at \$3,200 asked. The developments on the third floor of the 700-foot level, and between the 700 and 780 feet levels, are said to disclose a very good quality of ore. The new discovery, east of the clay wall between the 700 and 780 feet levels, is now four feet wide, and continues as good as previously reported. The drift from the 780-foot level, running toward the new shaft, is in 150 feet. The new shaft was 320 feet in depth on the 7th inst. During the month of June the yield of Bullion was \$117,728 23 from 3,302 tons of ore.

**YELLOW JACKET.**—Shows a marked decline since our last reference, falling from \$1,600 to \$800, and closing yesterday at \$1,000. A considerable quantity of pay ore is obtained from the north mine, while in the south mine, it is reported, the ore is decreasing in quantity and quality, about 75 tons being the daily product.

**CROWN POINT.**—Has changed hands to a considerable extent, rising from \$1,550 to \$1,700, then selling at \$1,500, and closing yesterday at \$1,445. During the week ending July 6th, 516 1/2 tons of ore were taken from the 400-foot level, and 136 tons from the 500-foot level. The winze from the 500 to the 600-foot level is 64 feet in depth, and a cross-cut from the winze was run 37 feet east, passing through unfavorable ground. Work has been discontinued at this point for the present. A drift carried east on the 400-foot level, near the Kentuck line, is said to look well. The body of ore on the 500-foot level has been opened 94 feet in length, and is said to look favorable at the south end, but at the north end it has narrowed down to about eighteen inches. The cash balance in the treasury at the close of June amounted to \$20,254 25.

**GOULD AND CURRY.**—Advanced from \$980 to \$725, seller 30, then sold at \$700, and at the close realized \$591. In the northeast drift, from the fourth station, the clay seam still continues in the middle; the rock on either side of it is softer and more damp than heretofore, indicating the probability of striking water. It is thought

that the ground is slightly more favorable for ore, as the rock is more quartzose. The mine is said to look well for a considerable quantity of ore. There are at the dumps some 3,000 tons of ore, estimated to yield about \$28 per ton. KENTUCK receded from \$635 to \$400, and closed at \$390.

**CHOLLAR-POTOSI.**—Has been active to a considerable degree, advancing from \$457 50 to \$485, declining to \$435, seller 10, and closing at \$430. We have no material change to note in regard to this mine. The new shaft has attained a depth of 69 feet below the third station—759 feet from the surface. The ore sent to custom mills during the week ending July 7th, amounted to 2,284 tons. From the annual report of this company for the fiscal year ending May 31st, 1867, we learn that the average per ton of ore worked was \$25 75, and the average reduction expenses \$14 97 per ton. The amount of ore mined and delivered to the mills amounted to 57,709 1/2 tons, showing an average cost of \$4 48 per ton. Compared with the previous year, it shows a reduction of \$1 51 per ton. From the Secretary's annual report we condense the following:

RECEIPTS.	
Bullion product.....	\$1,520,946 93
Ore sold.....	27,374 30
Other receipts.....	22,903 79
Total.....	\$1,571,225 02
DISBURSEMENTS.	
Labor account.....	\$264,198 96
Working ores.....	761,853 25
Dividend No. 1.....	17,000 00
Other expenses.....	174,054 50
Cash on hand May 31st.....	108,947 21
Total.....	\$1,317,053 96

**OPHIR.**—Opened at \$340, receded to \$320, and closed at \$300. This company is taking out some six different assays of which, made on the 6th instant, show an average yield of nearly \$400 to the ton. The drift in the north mine is being carried alongside the ledge at the rate of four feet a day, which is double the distance made in running it on the ledge. Cross-cuts will be run through the ledge at intervals.

**OVERMAN.**—Continues to be actively dealt in, declining from \$225 to \$195, seller 30, improving to \$250, and closing at \$230. The annual meeting of the stockholders of this company was held on Thursday last; 2,921 shares out of 3,200 were represented. J. J. Robbins, A. K. Grim, J. E. de la Montagnie, John Sime, and H. L. Hill, were unanimously elected Trustees for the ensuing year. Mr. Montagnie was subsequently chosen President, and T. Norwood, Secretary. A series of resolutions were adopted censuring the late Board of Trustees for removing Mr. McCullough from his position as Superintendent of the mine, and thanking that officer for the manner in which he had performed his duty, and endorsing Messrs. Robbins and Montagnie in opposing the action of the majority of the Board. Mr. McCullough was appointed Superintendent, and the suit commenced against him by Mr. Curtis for the possession of the mine, in the name of the company, was ordered to be discontinued. The balance of cash in the treasury, as near as can be ascertained, amounts to more than \$38,000. Yesterday, at the adjourned meeting, Messrs. Sunderland and Barron were elected trustees in place of H. L. Hill and A. K. Grim, resigned.

**BELECHER.**—Advanced from \$380 to \$460, receded to \$400, and closed at \$380. IMPERIAL improved from \$210 to \$214, closing yesterday at \$212. The aggregate sales of Stocks and Legal Tender Notes, etc., since Saturday last, amounted to \$1,459,964.

**ELECTION OF OFFICERS.**—CALIFORNIA S. M. Co.—Trustees: Thos. Bell, Jos. Barron, C. T. Emmet, A. C. Peachy, and Wm. E. Barron. President, Wm. E. Barron; Secretary, George Staacke; Treasurer, Thos. Bell; Superintendent, P. N. McKay. Office, corner California and Sansome streets.

**CHOLLAR-POTOSI M. Co.**—Trustees: A. K. P. Harmon, Thos. Bell, Lloyd Tevis, Wm. E. Barron, Chas. Hosmer, Thos. Sunderland, and A. Hayward. President, A. K. P. Harmon; Secretary, W. E. Dean; Treasurer, Wm. C. Ralston; Superintendent, Isaac L. Requa. Office, 428 California street.

**OVERMAN S. M. Co.**—Washoe, Nev. July 11th. Trustees: J. J. Robbins, J. E. de la Montagnie, John Sime, A. K. Grim, and H. S. Hill. President, J. E. de la Montagnie; Secretary, T. Norwood; Superintendent, H. V. S. McCullough. Office, 619 Montgomery street.

Contributed for Our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

169.—We have received several very rich specimens from the famous Green Emigrant lode, Bald Hill, near Auburn. This mine was located in 1865, and has proven to be of extraordinary richness. The specimen which we have numbered as above, shows coarse free gold, in hard white quartz, free from sulphurets.

170.—Is a piece of soft argillaceous talc, showing numerous small, but well defined cubical crystals of iron sulphurets, and two or three larger ones, very much decomposed. The latter show very coarse gold. More or less fine gold is seen imbedded in the talc, having evidently found their way thither through the agency of sulphurets.

171.—Consists almost entirely of gold; much of it, no doubt, left by the decomposition of sulphurets; but the largest portion probably found its way into the quartz apart from any contact with sulphurets.

172.—W. Collins sends us several samples of ore from the "Collins claim," two miles south of Georgetown. These specimens are from the ledge, where it is tapped by a tunnel, at a depth of 150 feet. The lode is six feet in thickness. Nos. 172 and 173 are highly charged with cupriferous sulphurets. A working test gives about \$10 to the ton—probably the sulphurets also contain a considerable amount of gold, which might be profitably extracted by concentration, and treatment by the chlorination process. The quartz is highly discolored from the decomposition of the pyrites, and is quite friable. No. 174 is a specimen of white, hard quartz, carrying regularly formed crystals of arsenical sulphurets, which are more favorable indications of gold than the cupriferous variety. We are not aware that any of the sulphurets found in this vein have been assayed.

THE NEW YORK METAL MARKET.—We learn from Winterhoff's circular that the dullness in the metal market still continues, although in some articles quite large transactions have taken place.

COPPER.—The low price which has ruled since April, having attracted some attention, several large purchases have recently been made. Four million pounds of Lake Superior have been sold for 23 1/4 to 24 cents for Portage Lake; and 24 to 24 1/2 for Detroit. The manufacturers as yet keep out of the market. The ruling price is still below the cost of production—hence it is perfectly safe to buy as a speculation. In England the best selected sold on the 30th of April as low as £76 to £77; but the market subsequently improved, and the last quotations are £82. The consumption has been reduced, but probably not less than the production. The smelters in the Atlantic States have no supply of either California or Chilean ore.

TIN.—The small stocks and low price of this metal has also induced several large purchases on speculation, at from 21 1/2 to 23 cents for Straits. Banca is quiet, with small sales at 25 1/2. English, nominal, at 22 1/2—all gold.

LEAD is quoted at 6 1/4 for ordinary foreign, with a few parcels of Spanish and German at 6 1/2—all gold.

A GOOD SIZED BERRY PATCH.—Mr. John Lusk, of the Pacific Fruit Market, of this city, has now under cultivation in Oakland, a lot of 90 acres, all in raspberries. The average yield will be about 1 1/2 tons to the acre, or one hundred and fifty tons for the entire ranch. This, at fifteen cents a pound, the usual wholesale price, would amount to the very comfortable sum of \$45,000. As many as 180 Chinamen are sometimes engaged in picking at one time. Every day's surplus is saved, and converted into wine.

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD

Monday, July 9.

Table listing various mining stocks and their prices for Monday, July 9. Includes items like 162 sbs Ophir at 330@340 per foot, 60 sbs Ophir at 330 per foot, etc.

AFTERNOON SESSION.

Table listing various mining stocks and their prices for the afternoon session on Monday, July 9. Includes items like 417 sbs Justis Independent Cons. at 12@20, 1 sh Kentuck at 475 per share, etc.

Tuesday, July 9.

Table listing various mining stocks and their prices for Tuesday, July 9. Includes items like 15 sbs Confidence at 63@62 1/2 per share, 25 sbs Segregated Belcher at 17@18 p ft, etc.

AFTERNOON SESSION.

Table listing various mining stocks and their prices for the afternoon session on Tuesday, July 9. Includes items like 824 sbs Ophir at 320@325 per foot, 180 sbs Ophir at 320@324 per foot, etc.

Wednesday July 10.

Table listing various mining stocks and their prices for Wednesday, July 10. Includes items like 120 sbs Ophir at 325@330 per foot, 180 sbs Ophir at 320@327 1/2 per foot, etc.

Table listing various mining stocks and their prices for Thursday, July 11. Includes items like 3 sbs Confidence at 70 per share, 5 sbs Segregated Belcher at 18 per foot, etc.

Thursday, July 11.

Table listing various mining stocks and their prices for Thursday, July 11. Includes items like 3 sbs Confidence at 70 per share, 5 sbs Segregated Belcher at 18 per foot, etc.

Friday, July 12.

Table listing various mining stocks and their prices for Friday, July 12. Includes items like \$5000 June 7 3 10 Bonds at 79 1/2 per cent, 40 sbs S. F. Gas at 63 per share, etc.

MINING SHAREHOLDERS' DIRECTORY

(Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.)

Comprising the Names of Companies, District or County of Location; Amount and Date of Assessment or Day of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Large table listing mining companies, their locations, assessments, and dividends. Includes entries for Adella, Sierra Co., Bullion, Storey Co., Belcher, Virginia, Nev., etc.

Latest Stock Prices Bid and Asked.

Table showing latest stock prices bid and asked for various companies and bonds. Includes entries for United States 7 3 10 Bonds, Legal Tender Notes, California State Bonds, etc.

MINING STOCKS—WASHOE DISTRICT.

Table listing mining stocks in the Washoe District, including Alpha, Bullion, Belcher, Bullion, G. H., Crown Point, Confidence, Chollar-Potosi, etc.

ROAD-MENDING IN PARIS is done by steam-rollers of about twenty-seven tons weight; fine sifted gravel is plentifully scattered over the surface of the road way, and this is broken small. The road mending is generally carried on at night; and you may often find in the morning some 250 to 300 yards of fresh roadway, smooth and fit for travel.

THEY have a girl of ten years in a private gymnasium at Roxbury, Mass., that lifts 370 pounds, one of thirteen that lifts 400 pounds, and one of fourteen that lifts 460 pounds. Roxbury is the home of the celebrated strong man, Dr. Winship.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

**Miner, July 6th:** A new tunnel, commenced for opening a series of parallel claims on the range of the Tarshish, has been named the Illinois tunnel. Immediately after the rich strike last spring, Mr. E. Arnold secured the second extension, north, on the Tarshish. The croppings of this lode were so wide that in order to secure the whole without chance for a future troublesome neighbor, Mr. A. located a series of claims, thus "corralling" the continuation of the lode, which is some time to rival the Comstock in the value of its production. It is thought the Illinois tunnel will pierce the rich portion of the lode within 300 feet of its mouth, and at sufficient depth to give promise of pay ore.

The failure of the Washington Company to make the mill at Davidson's perform satisfactorily last fall, combined with the knowledge that the Leviathan ore is of a similar refractory nature with the Morning Star there tried, has put a damper on operations in the East, and the owners here, it is thought, will take the matter in hand soon and see what can be done.

An offer was made yesterday by a responsible party, for fifty tons of ore now lying in the tunnel of a claim in this county, of \$100 per ton, the purchaser to take it where it now lies. We also have reason for believing that this mine might, with proper management, furnish enough such ore to keep a small mill running and be a profit to its owners, instead of, as now, feeling in their pockets every six weeks for cash in the shape of assessments.

One of the workmen in the Tarshish mine, an old miner and man of good judgment, offers to bet a month's wages against an equal amount, that he can pick three men to go in with him and in one day take out ten thousand dollars' worth of ore from the lode as it now stands.

While "working up" the old Sunshine claim, Mr. Ray, one of the present proprietors, found several small veins of ore, samples from which looked well, and on being pulverized and horned out showed a residue of fine appearing blue-black sulphurets. An assay made by Mr. Graff gave a product of \$108 in gold and silver to the ton. The amount in sight is not large, but the vein matter of the lode is from 20 to 30 feet wide, and several of these small ore-veins are scattered through it. It is a galeniferous ore, also hearing zinc, and like most of our ores, refractory, though it will smelt with great ease and he profitable ore if a sufficient body is found. It will be further explored.

In the Ringgold tunnel a soft decomposed substance resembling the rich pocket ore of the Tarshish has been struck. They have been running in very hard quartz for some time, and if this change does not lead immediately to a body of pay ore, which is probable, it will enable them to make better headway. Having recently secured indisputable title to their ground, the company will prosecute the work more vigorously than ever.

## Colusa County.

A correspondent of the *Sutter Banner*, writing from Wilbur's Springs, says: "A prominent citizen of Marysville, Dr. S. J. S. Rogers, has been prospecting out here, and has located the water privilege of Sulphur creek, from this place to the mouth, for the purpose of running a quartz mill, which he proposes building."

## El Dorado County.

**Placerville Courier, July 6th:** The Woodside mine, at Georgetown, is at last free from water, and the workmen are sinking in the main shaft. In a short time they will commence drifting out the rich ore, which was in sight last fall when the water run them out.

On the Eureka mine they have an engine and hoisting works. The shaft is down 130 ft. from which a drift is being run to the east. In this drift they have some very rich rock, but as yet the main ledge has not been reached.

The formation in this (Georgetown) district is generally a talcose slate, particularly the hanging wall. The quartz is well filled with rich sulphurets, and ledges vary in thickness from 6 inches to 12 feet, and it is very common to find a ledge with well defined walls, from 4 to 8 feet in width.

The main shaft on the Taylor mine, owned by H. E. Greene, of San Francisco, is 10 ft. 8 in. by 6 ft. 3 in., timbered and has a partition in the middle. It is an incline, with an angle of about 60 degrees, and is down 10 feet. The lode was followed down

something over 60 feet, at which point it was broken up and run about perpendicular, but the main shaft was continued on its regular grade, and at 100 feet a cross-cut was made running in a northwesterly direction until the ledge was cut, at which point the range of the ledge was about 10 feet west of the main shaft. The ledge varied in thickness in going down, but at 100 feet it is from 18 inches to 3 feet, and shows more free gold than at any other point. After cutting the ledge in the cross-cut, a drift was run about 20 feet north and 20 feet south. The walls at this depth are well defined and over 6 feet apart, and binds the streak of quartz. This formation is of black slate or gouge, well filled with sulphurets and fine streaks of quartz, which looks like the formation in Hayward's mine in Amador, and the Golden Rule near Jamestown. It is the intention of the owner to continue the main shaft down 100 feet further. There is an engine and hoisting works on the ground, which will either be put up, or larger horses obtained and the sinking continued by whim.

Low Mining Company has a shaft down 100 feet; ledge 8 feet thick; shaft to be sunk 60 feet further.

The Mount Hope shaft is down 61 feet; ledge broken up, but will be from 4 to 6 feet thick.

Philadelphia Slide, a new location, on which but little work has been done; this ledge is about 6 feet wide.

North Canyon Company, also a new location, and as yet has had but little work done on it. Arrangements are being made to fully test this mine as well as the rest during the summer and fall.

## Humboldt County.

**Times, June 29th:** Prospectors at the Shasta Bnttes have been successful in finding coal in three different places.

## Inyo County.

C. F. Duval, writing from Lone Pine district, Inyo county, Cal., to the *Territorial Enterprise*, of July 7th, says: "The mines, I cannot deny, are rich, and there is not one claim located that will not pay from the surface. The great difficulty is, there is no water. The Mexicans are the only ones who work their ore and extract silver. I have some rock ready for the furnace, but there is no water to finish it. A person of means, say \$5,000, if there was water, could double his capital every two months, by building furnaces capable of smelting from 5 to 10 tons per day, the largest in the district being 250 pounds per day. I am cool and deliberate in writing this letter, although I am seated upon two sacks of ore worth \$300 at least."

**Visalia Delta, June 26th:** The editor has seen some specimens of silver-bearing rock from the Kearsarge lode, in the Hot Spring district, Inyo county, in which the pure native silver may be seen "sticking out" in every direction. The rock pays, with close working, some \$600 per ton, and the lode is large, clearly defined, and apparently inexhaustible.

Work is being pushed forward in Kearsarge, Alabama and Lone Pine districts. In the first they are enlarging Capt. A. B. Paul's mill, and will soon be crushing. In the Alabama, work with arastras, furnace, etc., is going on briskly, while the Lone Pine region is "like an ant-hill" with busy miners, who have five or six furnaces, numbers of arastras, etc., and are bringing in the precious metal daily.

## Kern County.

**Havilah Courier, June 29th:** A new vein has been discovered near Agua Caliente. It has been named the "Relief." The vein will average two ft. in width, and has been traced 1,000 ft. on the surface, and prospects well its entire length. A shaft has been sunk 10 ft., and some of the richest rock ever found in the county taken out.

Another lead, the Phenix, has been discovered in New El Dorado Dist. The vein crops out round a hill for hundreds of yards, and in no place is less than two ft. wide, in many places six ft. of rich rock, that will pay not less than \$50 per ton.

The Queen Victoria has been traced 300 yards. The ledge is from six in. to two ft. wide, of exceedingly rich ore.

On the St. John mine, two shafts have been sunk, one 50 and the other 42 ft., disclosing a fine body of rich ore. St. Jean & Co. have made arrangements to have an 8-stamp mill put up.

In Piute Dist., Erskine & Co. are down on the Big Indian lode 50 ft.

Raines Co., on the Bright Star lode, from a recent crushing of 500 lbs. of rock crushed in their arastras, obtained \$500.

Bird & Co. are making one oz. to the hand in their placer claims.

## Nevada County.

**Gazette, July 8th:** A number of specimens taken from the Mary Etta mine, contains considerable coarse gold, and abound

in auriferous sulphurets. The rock is but little worn, indicating that they were detached from ledges in the immediate vicinity. The ledge has been traced a distance of 1,000 ft., shafts having been sunk upon it at depths varying from 14 to 60 ft., showing a vein from three to five ft. in width. The country rock is a soft granite and easily worked. The Enterprise ledge, near by, is small, but very rich, the rock paying by mill process \$45 a ton. This ledge is also in soft granite. The South Yuha Mining Co. have recently commenced operations on their ledge, which has been lying idle for six years, and have favorable prospects.

The cement mill formerly owned by Cozzens & Garber, between Red Dog and You Bet, which was purchased by Nece & West, will be started in operation again the latter part of this week. The present owners will continue drifting until they strike the regular pay lead.

**Transcript, July 9th:** Holburt & Co.'s claims at Diamond Creek, were cleaned up after twenty days' work by two hands and yielded 17½ ounces, worth \$19 per ounce.

**Excelsior.**—Meadow Lake *Sun*, July 6th: Twelve hundred pounds of sulphuret rock, taken from the Union Ledge No. 2, Excelsior Co.'s claim, were burnt in a small prospect furnace, constructed after the Knapp & Peacock model. The rock, after passing through the furnace, was completely desulphurized. It takes about 2½ hours to destroy the sulphurets.

The California Co. have 25 men in their mill and mine. Rock is being crushed in the mill from the Green Emigrant, and is paying well. The California Co. are down 100 feet on the Knickerbocker Ledge, and are drifting from the shaft. There is plenty of good ore in the bottom of the shaft. In a few days the company will be crushing rock from their own ledge.

The Mohawk & Montreal Co.'s Mill is now running. They have the finest mill in the district; and will undoubtedly make a good run. We now have four mills running; that is, the U. S. Grant, Mohawk & Montreal, California and Excelsior.

The Gold Run Co. have run their tunnel in 210 ft.; the ledge is 4 ft. wide. The ores from this mine are heavily filled with sulphurets, which, under a common burning process, shows as much gold as we have seen obtained from a like quantity of rock in this district.

The Excelsior Co. have started up their mill and are now crushing rock from Union Ledge No. 1. The rock is from the surface, contains much free gold, can be easily worked, and a good return is expected. The Excelsior Co. have hundreds of tons of desulphurized ore on the tops of their two ledges, which will pay well for working by ordinary mill process.

The Kentucky Co., at Snow Point, Eureka Township, is working away in good earnest, sinking for the "Blue Lead." A shaft is down 150 feet and will, it is thought, strike the bed-rock at the depth of 250 feet from the surface.

**Gazette, July 10th:** The U. S. Grant Co. are progressing rapidly in the work of opening and developing their mine. Their mill is kept running regularly, the rock yielding good pay, and three 8-hour shifts are kept at work sinking on the ledge. It is probable the company will erect a 20-stamp mill this summer.

July 11th: The snow at Meadow Lake is all gone, except in a few spots, where it drifted to a great depth in the winter. The California Co. have sunk a shaft on the Knickerbocker ledge, 100 ft. A tunnel is now being run to strike a chimney on the ledge. Considerable native copper is found in this ledge. Work will soon be commenced on the California, Indian Boy, and Indian Queen ledges. The California mill is crushing ore from the Green Emigrant. The rock will pay \$50 per ton. The Excelsior Co.'s mill has just been started up. The owners of the Phenix ledge have resumed operations. The ore prospects well. The last clean up at the Golden Eagle Co.'s mill yielded \$20 per ton. The Lightfoot Co. are taking out rock for crushing. The Enterprise Co. have let a contract to sink 50 ft. deeper on their claim.

## Placer County.

**Herald, July 6th:** Last Chance quartz claim, on Rock Creek, owned by Lawler & Co., is now prospected to the depth of 16 ft. and shows well in free gold. The owners are greatly encouraged, and intend to prosecute their work with vigor.

Mr. Walter has recently been sinking a new shaft on his quartz claim, near Doty's Flat, and on Wednesday evening last struck it richer than ever. Our informant remarked it paid \$40 to the handfull.

**Dutch Flat Enquirer, July 10th:** Work has been commenced on the Blue Bell. The vein is narrow, at one point only reaching a

width of about two ft. Repeated proofs have shown it to be rich in free gold at the surface.

**Auburn Stars and Stripes, July 10th:** On the 4th instant, Mr. Waldamer, in his claim between Ophir and Doty's Flat, struck a vein of gold-bearing quartz, or rather quartz hearing gold, that completely eclipsed the Green Emigrant or any other mining yield ever before made in Placer county. Within three days \$18,000 was taken out, the cold chisel having been required to cut out the solid gold in some instances. (A national strike.—Ed.)

## Shasta County.

**Courier, July 6th:** The Baker quartz ledge, at French Gulch, prospects surprisingly rich, and shows every indication of being a ledge of extraordinary value. As high as \$75 has been obtained from a piece of rock taken from this claim. The rock is decomposed and porous, resembling honey-comb in appearance.

The Highland mill, at French Gulch, is being repaired and improved, and will soon be the most complete mill in the county. With the addition of five more stamps, the mill can reduce a large quantity of rock per day.

A prospecting party has left Copper City for the headwaters of McCloud river, where it is supposed good gold diggings may be found.

## Sierra County.

**Mountain Messenger, July 6th:** The Von Humboldt Quartz Co. are steadily going on with their tunnel, and contemplate putting on another shift, to run night and day. The prospects of this claim are flattering.

A ledge of rich quartz has been discovered about three miles above American Hill. Specimens of the rock show plenty of free gold.

The Monongahela drift claims at American Hill are in a prosperous condition. They lack only about 30 ft. of having their new tunnel completed.

Some very rich quartz has been recently discovered near Gibsonville, in the northern portion of the county, some specimens of which are literally filled with gold.

The North American Gravel Co., at Hepesidam, took from their diggings on the 26th ult. a piece of gold weighing 17 ozs. The mines in that section are reported to be paying extremely well this season.

## Siskiyou County.

The Yreka *Union*, of July 6th, proposes that a wagon road be made from Scott's Valley to Sawyer's Bar, on Salmou River, for facilitating the transportation to and from the Salmon River mines.

## IDAHO.

**World, June 29th:** A Portuguese company on Orleans Bar, opposite Pioneer City, made a clean up after a run of 13 nights—not working in daytime—and took out 110 ozs. The same company's previous clean up, after a run of 11 nights, netted 105 ozs. and \$9. In the Bar claims of Wilson & Giberson, one week's run of sluices has yielded \$7,000. Davis & Co's claim has just given upwards of \$2,000 after a week's run.

The Lemhi correspondent writes from Leeshurg, June 17th: There are about two dozen claims paying over expenses. Some Idaho boys opened ground, at a heavy expense, which pays from three to four dollars a day. An Idahoan named McCafferty sold to some boye one interest for one thousand dollars, when the snow was on the ground. They have since abandoned the claim and gone back. The country has no appearance of mineral resources. From surface to bedrock is a mass of nigger-head boulders. As yet I have not seen any quartz gravel. The country is going and will soon be gone. Crowds are leaving for Montana. Hundreds say they would return to the Basin were it not for John Chinaman not leaving a vestige to live on. Board is \$15 per week; meals \$1. I have not seen \$100 since I have been here. Every one seems broke. I would say to one and all, stay where you are. The whole country seems a mystery—one-half thrown up by eruptions, and a pity the other half wasn't blown away.

A new excitement and general stampede has occurred, on account of a report that rich gold diggings had been struck a few miles from Idaho City, on the south side of Moore's creek.

**Owyhee Avalanche, July 6th:** The Silver Cord mine is improving. The Woodstock mine is yielding rich ore from a 14-inch ledge. The North Star is turning out some fine ore. McCready and others are driving a tunnel to strike an extension north of the North Star. They expect to strike the vein at 80 ft. The Poorman and Oro Fino are turning out rich rock as usual. Some 13 tons of Whiskey ledge rock has been worked in the Minoar mill; assayed value, \$1,519.48.

Several more mills might be supplied at a profit on War Eagle.

The Potosi has out some extra rich rock. Haight and others are opening a rich gold ledge on Florida Mountain. The Baxter, a newly discovered ledge, is 14 inches at the present depth, 40 ft. It is yielding ruby and sheet silver, and polybasite, and also fine black sulphureted ore. The vein is soft, and no blasting is required. Ore from the Leviathan ledge will pay \$1,200 per ton. The Silver Monarch prospects rich.

**Leviston Journal, June 29th:** An astrata has been started on Smith's Gulch, Warren's diggings. Three tons of ore from the Hic Jacet ledge yielded \$52.85 per ton. At Pierce City a few claims on the new ditch are paying well. Some parties have been working the sluices of both whites and Chinamen.

**World, July 3d:** J. P. Lamling has lately commenced crushing ore from the Juniata ledge, at Rosenbaum's quartz mill. It has averaged \$116 per ton. New diggings have been discovered on Lost river, a tributary of Boise river. Prospects of from 5 to 15 cents per pan have been found. The gold is fine and resembles Moore's Creek district.

**NEVADA.**

**Esmeralda.**  
**Enterprise, July 9th:** Parties recently in from Pine Grove, Wilson district, Esmeralda county, state that mining operations are more active than ever. Chevalier & Palmer have struck a very large body of rich ore in the tunnel of the Mountain View, and the Wheeler boys have also struck a rich ledge of rock in the Wheeler claim that will pay several hundred dollars per ton, and that they are now taking steps to get a mill of their own. The ore in this district is worked solely for the free gold it contains.

**Enterprise, July 9th:** Ore has been struck in the 400-foot level of the Belcher that will yield \$50 per ton.

**Humboldt.**  
**Register, June 29th:** Hon. J. A. Banks, after visiting the principal mining districts in the State, returns thoroughly satisfied with the mineral resources of Humboldt. He proposes to address the Miner's Convention here on the 4th of July. A proposition will be made to establish a uniform assessment year throughout the country, to harmonize as far as possible the various district laws, and provide a fund for their publication and circulation.

**Unionville Register, July 6th:** W. S. Sargent has a deed from E. Page Davis, of New York, to the Mountain King S. M. Co. for mining property in Echo district, bearing \$1,200 revenue stamps. The consideration is \$600,000.

**Pahravanagut.**  
**Reveille, July 2d:** Mr. Evans has entered into contracts with agents of companies for the erection of two mills, one of 10 stamps, and the other of 20 stamps, which are to be constructed at Hiko, for dry crushing and roasting. It is intended that work on them shall be pushed forward at the earliest practicable moment, and that the machinery shall be on the ground ready to be put in place. There are from 300 to 400 men in the district, the larger part of whom are engaged in mining, and greater activity prevails than ever. Mr. Evans visited several of the principal mines in the district, prominent among which are the Illinois and List, all of which are now worked to advantage. The first attempts at mining were rude and generally injurious, but a good system has at last been arrived at under which the most flattering developments are made; and it is known that there is sufficient valuable mining property in the district, without taking into account probable discoveries, to render it ultimately one of the most important in the State. Considerable work has been done at random over a large surface, and few if any of the veins have been opened to the depth of 80 ft., and those that have reached that depth show large veins and good ore. The Illinois has penetrated to the depth of nearly 100 ft., and develops a large body of fine mineral.

**Reese River.**  
**Reveille, July 2d:** The machinery of the mill on the lower grade, formerly known as the Union, has been taken down and several loads hauled to Hot Creek, where it is to be erected immediately. The new mill will be of the same capacity as the original, which had 10 stamps, and will be furnished with furnaces for roasting the ore. In anticipation of its speedy erection the miners of the district are employed in taking out ore for its supply.

The largest and most valuable bar of silver, yet produced in this city, was exhibited yesterday at the assay office of Bolt & Stetefeldt. It weighed 1,535 ozs., and was valued at \$1,945.64. Its weight was greater by several ounces, and its value by several dollars, than the largest and most

valuable bar hitherto produced here. The bullion is of uncommon fineness, and was obtained from ore of the Bael North Star, reduced at the Parrott mill.

**July 31:** The Chihuahua ledge, in Newark Dist., varies from three to five feet in thickness, the whole body of which will furnish milling ore above the average quality. The tunnel has been run into the hill the length of 110 ft., out of which 1,000 tons of ore are estimated to have been taken, and the workmen are still employed in the work of extraction. A location has been made on the extension of the Chihuahua, from which the owners take out handsome ore. The mill of the company is situated in Gillson Valley, which is believed to extend to the Humholdt, where a good supply of water may be obtained from a large brook, but the immediate vicinity of the mill site is deficient in timber, plenty of which exists on the southern and western slopes of the mountains. The Chihuahua mine is situated on the hillside about half a mile west of the mill. The mill was commenced last January, and will not be completed before the close of next September. It will be of the capacity of 20 stamps, and the battery will be arranged for wet crushing. The mill will not be provided with roasting furnaces. The mill structure is of wood, placed upon foundations of stone, and its various parts are substantial and well arranged. The experiment of attempting the reduction of the ores of the district without the aid of fire seems to be hazardous, and leads one to question the experience and intelligence of the management. A simple analysis of the ore would show whether or not it could be profitably reduced by amalgamation. Except upon the surface, the ore contains a large proportion of sulphur, and fire would appear to be the certain means of saving its silver.

Sufficient work has been done on the Lincoln ledge to determine its good character. There are also a number of ledges in the hands of small companies, that exhibit good size and fair quality of ore, many of which will be worked if the operations of the Centenary Co. prove successful.

**Washoe.**  
[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

**Trespass, July 2d:** The Puebla mine, in Surprise Valley, is turning out some very rich ore. The district was discovered late last fall, and quite a number of ledges located. The Puebla has been prospected but little, but the rock is very rich in mineral. Some very rich pieces have been exhibited, being a portion of 2,000 lbs. brought to this city, obtained at a depth of 10 ft. on the croppings. A cross-cut run through the vein shows its width to be 10 ft. with well-defined walls. A small quantity worked at the Mariposa mill yielded \$214 in gold and silver per ton, silver predominating. The ore resembles that taken from the famous Highbridge claim, at Belmont, and is very rich. One hundred lbs. of the ore was sent to San Francisco yesterday, to Miles Goodman, who is a large owner in the claim. The balance, some 1,800 lbs., will be worked here, and if the practical return is as large in mineral as there is reason to suspect, a mill will at once be despatched to the district, and the mine will be opened.

**Enterprise, July 4th:** Yesterday Mr. J. B. Hill brought up from the Gould & Curry mill 27 bars of bullion, weighing over 2,100 lbs., and worth \$60,000. The bullion is from Savage ore.

**July 7th:** The Gold Hill Q. M. & M. Co. yesterday declared a dividend of \$15 per share, almost \$600 per foot.

The Savage Co. have declared a dividend of \$300 per share for the present month, an increase of \$100 per share over last month.

**Gold Hill News, July 6th:** The Kentucky Co. have declared a dividend of \$40 per share, payable on and after July 18th.

**MONTANA.**

**Post, June 15th:** A nugget was found in Cooleys' Dry gulch, just below town, weighing \$593.45. The Rock Creek stampers have not yet been heard from.

Wm. Margetson, writing from Virginia City, Montana, June 9th, says snow fell in the valleys to the depth of six inches, on the 5th and 6th inst. The miners are doing little or nothing in mining operations, being froze up; they are patiently waiting for the melting of the snow, and a warm spell of weather. So says the San Bernardino *Guardian*, of June 6th.

**OREGON.**

**Oregonian, June 25th:** The editor has seen some beautiful specimens of gold-bearing quartz, obtained on the east side of the Willamette, 50 miles southeast of Eugene City. The pieces of rock were threaded with gold to an extent which gave them the appearance of being largely composed of

that metal. Several ledges have been discovered in the vicinity where these specimens were obtained, and is believed that some will prove really valuable. The pieces of rock we saw were obtained from a ledge which projects above the surface of the ground; and though narrow, the ledge presents an excellent appearance.

**UTAH.**

**Salt Lake Vedette, July 1st:** Lewis Robinson and two other men brought into this city on Thursday last 40 ounces of gold dust, which they had crushed out of quartz in two days. The dust was assayed by Bohm & Mollitor, of this city, and run into a bar that weighed 38 31-100 ounces, and was valued at \$740.06. Its fineness is 934 1/4. The only account the discoverers have as yet given is, that the mines are about 200 miles from here and are rich. Outsiders locate the mines in the Green River country somewhere, from the fact that Robinson owns a ferry on that stream. That there are good gold mines in Utah is beyond a doubt, but they are concealed by those who know where they are, and prospecting is very much discouraged.

**WASHINGTON.**

**Dalles Mountaineer, June 25th:** Quartz has been discovered on the Met-how River, Washington Territory, and there is no doubt but what there is extensive placer diggings in that region. A place was found where a party of miners had formerly been at work. An Indian stated that a number of years ago a party of white men had mined there, but they left to go to Frazer river. They had done considerable work, and from a little prospecting by Mr. Howe, he is satisfied that the diggings will pay wages. The party that are prospecting on the Wenachee, are supposed to have good diggings.

**Cox's CEMENT MILL.**—This mill, to which we have already alluded, consists of an iron pan six feet in diameter and eighteen inches deep, in which four iron rakes or stirrers are made to revolve. A large stream of water pours into the pan, and the fine stuff finds its way through small holes under the false bottom. The large stones are discharged through a gate. There are two sluices connected with the pan, one to carry off the coarse stones, the other to carry away and wash the fine dirt and gravel, which contains the gold. Mr. Hittell, of the *Alta*, who has recently witnessed the operation of this machine, near Placerville, writes of it as follows:

The first mill was not made strong enough and has been broken; but after it had been at work some time, I saw that the clay was thoroughly separated from the stones, leaving these clean and bare. I am therefore disposed to accept the general verdict that the success of the invention is no longer doubtful. The cement consists of gravel in a very tough clay, so tough that the mass in the mine must be broken down by powder, and the fractures go through stones as well as clay. The stamp mill by which the hard cement has been reduced heretofore, has to spend much of its power in crushing the stones which contain no gold. These rakes save that unnecessary trouble, and it is estimated that Cox's mill will wash cement at an expense of less than a bit a ton. A few weeks will decide the question, and if present expectations are realized, we shall see another important advance made in the art of mining and in the production of gold.

**ICE QUARRIES.**—The Glaciers of the Alps are worked for ice precisely like stone quarries for their products. Not only so, but they are also excavated into galleries. Some of these galleries have been fitted up for places of resort, and magnificently furnished as saloons. The depth of snow and ice exclude the beams of the sun; but the calcium light sheds its brilliant luster through these unique chambers, which is reflected as from thousands of mirrors of glass. Such an establishment, with all the conveniences of a well appointed parlor, would have been a most inviting place of resort and repose during the hot days of last week in this city.

**HIDDEN TREASURE FOUND.**—It is reported that a large amount of treasure—\$340,000—has recently been unearthed by some negroes near Pensacola, Florida. It was in a wooden chest in a brick vault, and must have lain in its resting place for a great number of years, as no one had any knowledge of it.

Saturday Morning, July 13, 1867.

## Notices to Correspondents.

AN OLD TRAPPER requests us, in the course of the jubilation indulged in at the recent annexation of a large part of Northwest America and the anticipated national enlargement of the fur trade in consequence thereof, to pay a few brief respects to the memory of an American, who probably in his own person combined enterprise, energy and inexhaustible perseverance to a degree that has never been excelled, if ever equalled, by any one person belonging to any country. Ledyard was with the celebrated navigator, Cook, during his last voyage, in the course of which he (Ledyard) became first acquainted with the immense value of the fur trade. The information thus acquired he first laid before the ship owners of New York and Philadelphia, by whom his views were received most coldly, notwithstanding Astor subsequently realized such an immense fortune therefrom, although he only to a small extent, comparatively, carried out similar plans to those pointed out by Ledyard. By the merchants of the cities named, Ledyard was informed that he might possibly find patrons at L'Orient. On this hint he at once took ship for Europe, and succeeded temporarily in obtaining promises of adequate assistance, which, however, his anticipated patrons failed to fulfil when the period for starting the expedition arrived. Ledyard then visited Paris, where he became acquainted with the celebrated Paul Jones, who at the commencement of the acquaintance lent a favorable ear to Ledyard's views—in fact, promised to engage in the speculation; but, from some unexplained cause, eventually withdrew from his engagement. Ledyard then determined to penetrate, unaided, into the fur region by land. With this object he proceeded to St. Petersburg, and succeeded in obtaining an interview with the celebrated Empress Catharine, from whom he obtained permission to visit Siberia. But in getting as far as Yakutok, he was arrested without any notification whatever, transported by post to the frontier of Poland, where he was dismissed with the warning never to set foot again into Russia, if he did not wish to be hanged. He arrived, ragged and penniless, in London, where, by the recommendation of Sir Joseph Banks, to the African Association, he was commissioned in 1788 to take charge of an employing party about to be sent into Central Africa. Poor Ledyard got as far as Cairo, where his life was abruptly terminated, owing to his having administered to himself an injudicious remedy for a bilious attack.

**BROOM-STICK.**—The modern popular belief in witchcraft arose contemporaneously with the Protestant Reformation. This fanatical belief was acquiesced in by no less a person than Luther. It is commonly considered to have arisen as a consequence of a distorted conception of the newly-awakened principle of faith that a higher agency than the Pope existed, and was presumed to be a demonstration against the agency on earth of his satanic majesty.

CONTINENTAL Life Insurance Company,  
302 Montgomery street, corner of Pine.

## The Magnesium Light in Mines.

## A VALUABLE INVENTION.

Every mine superintendent and mining engineer must be aware of the great advantage which the presence of "daylight," even for a few minutes, would be in their daily or weekly examinations of the condition of a mine, especially in the searches for faults or cracks in the roof. As the mine foreman goes about in the various drifts and galleries, particularly in a mine with bad ground, how eagerly he scans the roof under which himself and the men under his charge must be daily and almost hourly exposed, often immediately after the most violent convulsions from blasts. How often does a small crack pass unobserved, even by the most critical eye, admitting the corroding and drying influences of the air to penetrate, until a large mass or flake falls, to the danger of life and limb.

Great and terrible as is the loss of life from explosions in the English mines, yet immensely greater is the loss from other accidents. Carefully compiled statistics show that for every single life lost from explosions, three are lost by falls from roofs! The loss of life from explosions, usually killing by the wholesale, gives such accidents a sensational character, whilst but little attention is paid to the individual casualties of most accidents of a different nature. The deaths from accidents in shafts were, in England, for the last two years, greater than those resulting from explosions; notwithstanding the explosions, during that period, have been more than usually frequent and destructive.

The chief portion of deaths by falls from roofs and from accidents in shafts, are caused by an insufficient knowledge of the faults and irregularities of the strata; a knowledge which it is almost impossible to acquire by the dim light of a candle or lamp, on the powder-begrimmed and dust-covered walls of a mine. What a boon, then, would it be to all, if the broad light of day could be poured into the mine, even for a few moments only, during the weekly or daily examinations for such faults which it is the duty of the proper officer to make.

## HOW IT CAN BE DONE.

British mining associations and government inspectors, while they have been unceasing in their endeavors to secure safety from other causes of accidents, have not been unmindful of similar needs in this direction, and have frequently called attention thereto. Within a few months past, a Mr. Latkin, who has been some time experimenting with the view of utilizing the magnesium light, has devised a lamp of that description for the especial use of persons whose duty it is to see that the mine is at all times safe from roof and wall faults. With this lamp in his hand, the chief underground manager is enabled to make as minute an examination into the details of the structure and condition of the walls and roof of a mine as though he was examining a wall in the broad light of day. The lamp is carried in the hand, and is not heavier or more inconvenient than an ordinary Davy lamp; while it is capable of producing the magnesium light, and shutting it off at will. A spirit flame is used to ignite the magnesium, which is used in the form of a fine powder, the flow of which can be stopped and turned on at pleasure; thus securing economy, in using the more expensive light only when occasion may require. By diluting the magnesium powder with fine sand, in varying proportions, any degree of light can be readily attained. This invention is exciting considerable interest among mining men and others in England. It is neither costly nor intricate in its operation, and is not at all liable to get out of order. Of course it can be used either as a naked light, or with a Davy protection. The invention, for one of its kind, is second in importance only to that of Sir Humphrey's.

## Home Trades and Manufactures.

**A FUSE FACTORY.**—In our issue of the 2d of February last, we made mention of a newly invented machine for the manufacture of blasting fuse, and of the fact that a manufactory for making that material would soon be established in this State. We are now happy to state that Mr. Eva, the inventor, returned from New York on the last steamer, whither he had been to superintend the construction of his machinery. That machinery is now in this city, and will be put in operation in about two weeks, in the building on Brannan street, between Third and Fourth streets, occupied by Mr. Korbel, as a cigar-box manufactory. A sufficient amount of machinery will be put in operation to supply the entire demand on this coast.

We have already spoken of the necessity of such a manufactory here. The importance of having fuse fresh from the manufactory is well understood by those whose lives are often endangered by working with a defective article. Much difficulty is encountered in the use of imported fuse from its deterioration in transportation. In passing through a hot climate the tar or other material with which it is served, is liable to penetrate to the powder, and destroy the continuity of the conducting medium of the fuse, thereby greatly delaying blasting operations, and endangering the lives of those engaged in such work.

**THE BARREL MANUFACTORY** on the Potrero is now nearly ready for active operation. A portion of the machinery was started up about a week ago, and several thousand staves have already been got out, more as a preliminary trial of the machinery than with the view of turning out regular work. The proprietors were disappointed with regard to a portion of their machinery, which arrived around Cape Horn, some three months since, and were compelled to dispatch an agent to the East to remedy the defect. That agent returned on the steamer which arrived on the 3d inst., and the works will soon be under full headway.

Considerable difficulty has also been found in procuring the right kind of wood, especially for pork and other barrels which require considerable strength, and have necessarily to be made of hard wood. Nearly all the California woods check badly, in seasoning, some so much so as to render them absolutely worthless. The proprietors prefer to "go slow" in their enterprise, at considerable cost, rather than to rush their work into the market in a slipshod manner. Their object is to establish a reputation for their manufacture from the start.

Every operation connected with the business, which can possibly be done by machinery, will be so done, and every piece of machinery will be of the most modern and improved character. Every kind of cask or barrel used on this coast will be turned out at these works. This establishment will be prepared to supply the demand for the entire coast, and at a cost which will admit of no possible competition from the East or from hand manufacture anywhere. This enterprise is one, the want of which has long been felt in this community, and we trust the proprietors will be amply rewarded for their investment.

**THE DANFORD ATMOSPHERIC LAMP** is a kerosene burner, introduced here recently from Philadelphia, by Messrs. Gillig, Mott & Co., well known hardware dealers, of Sacramento, who have the exclusive sale of the same for the States of California and Nevada. This lamp gives a clear, steady, brilliant light without the use of a chimney. By clock-work, a fan wheel is made to revolve with great rapidity, throwing a steady current of air upon the flame, thus insuring perfect combustion, brilliancy of flame, and at the same time preventing smoke or any disagreeable smell from the oil. Sold in this city by E. Ayers, Washington street, opposite post office.

## Prices of Breadstuffs the Past Year.

The enormously high prices of breadstuffs the past year at the East were more the result of combinations of speculators than of any actual scarcity of supply. The crops, both in the Atlantic States and in Europe, were indeed less than usual; but the surplus would have been amply sufficient to have met all contingencies. The "corner" was successfully maintained, longer than was anticipated by the speculators themselves, notwithstanding the heavy shipments from California. Of course that fact was greatly to the advantage of this State, although the chief profits therefrom went to the middle men, rather than to the benefit of the growers. We were told, at one time, that California wheat, which had been shipped to France, had re-crossed the Atlantic and gone west to Chicago. The inference was that Chicago was sending to this State for wheat. Nothing could be further from the truth. The wheat re-shipped from France was a small sample lot, and was received at Chicago at a time when the warehouses there were full. Upwards of 4,000 tons of wheat, and a still larger quantity of flour, was on store in Chicago when that wheat reached there, and the daily receipts were fully equal to the current demand. The story was circulated and garnished for the interest of the speculators.

About the same time the dealers in New York were astonished by the arrival of two or three cargoes of wheat from Liverpool. The fact of that importation was trumpeted abroad as an evidence of an approaching scarcity in the New York market. It is now pretty generally suspected that those importations were made at a great loss by heavy holders in Chicago, who took that method to counteract the efforts of the speculators who had sold "short," and who were endeavoring, by every possible artifice, to "bear" the market, so that they could settle their differences with the least possible margin of loss.

**WORCESTER'S IMPROVED GLOBE VALVE.**—Mr. J. M. Thompson has left at this office one of Worcester's improved globe valves. The improvement appears to have a decided value, which only needs to be seen by engineers to be appreciated. It consists in causing the valve to rotate on the screw-stem, which raises or lowers it in such a manner as to allow of its wearing a perfectly tight seat, through any scale or mud which may accumulate on the seat or valve, and which by its presence often causes leakage and damage to the valve. This valve is being rapidly introduced in most of the western cities. The right for this coast is for sale by Mr. Thompson, at the Mammoth mills, Plumas county. Further information may be obtained by calling at this office, where one of the valves may be seen.

**THE CITY COLLEGE.**—The sixteenth session of this well known Educational Institute commenced on the 5th inst. The faculty of this institution consists of nine Professors and Teachers of ability and experience. The course of instruction embraces all the studies usually pursued in the best Grammar and High Schools, as well as in regular Collegiate Institutions. Attention is also given to physical as well as mental and moral culture. Its situation, being located in a convenient yet retired portion of the city, near Union Square, with all its other advantages, and its thorough course of study, renders it a most desirable place for instruction. Rev. P. V. Veeder still continues the Acting President of the Institution.

**WHO WANTS A BUILDING LOT?**—The extensive auction sale of the real estate of the late J. C. Beideman, advertised in another column, presents one of the most favorable opportunities for securing a homestead ever offered in this or any other city. A wide margin in choice, as to situation, and plenty of time for payment, is afforded.

**A NEW SAVINGS BANK.**—We would call the especial attention of our readers, miners, and manufacturers, to an advertisement in another column, of the "Farmers' and Mechanics' Bank of Savings," 225 Sansome street. This is a new banking institution, incorporated under the banking laws of the State, and approved April 11th, 1862. Its Directors are among the best men in our community—men of wealth, and of high social and moral standing—thus giving to the community a guarantee of permanency and usefulness. Such an institution as this promises to be, has been long wanted by the farmers, drovers, miners and manufacturers of the State. Deposits as small as one dollar are received—thus meeting the wants of those who are anxious to accumulate from small beginnings.

Parties can make their deposits from time to time, and draw them, as in other banking institutions; and can deposit them for temporary or permanent purposes, receiving interest thereon, after a certain length of time. The miner can remit his gold dust, his money or his bullion, for sale or for coinage; and check against the same, or leave it on deposit, drawing interest. We know of no institution organized among us, giving more promise of success and usefulness.

**LEVEY'S FIRE EXTINGUISHER.**—A trial of Levey's Fire extinguisher was made on Tuesday evening last, under the supervision of the Fire Department. A 12x12 building, of redwood, containing several tar barrels, a lot of shavings steeped in coal oil, etc., was prepared for the purpose on Union Square. The building was fired, and when the signal was given by the Chief of the Board, Mr. Levey approached with his extinguisher, and succeeded in putting out the fire. He had the flames under control in less than two minutes, and they were completely extinguished in about two minutes more. The universal verdict was that the trial was a success. It would appear to be almost impossible for a fire to spread much if one of these machines could be brought to bear upon it before it had got much headway. We shall probably give a full and illustrated description of this novel fire extinguisher next week.

**CROSSING THE OCEAN ON A RAFT.**—Three persons started from New York on or about the 1st of June, to cross the Atlantic on a "raft." This novel seagoing craft is designed as a life-saving raft, constructed chiefly of inflated water-proof material. There is no hold or cabin upon it, everything being exposed to the action of the wind and waves; but the adventurous party have confidence that the raft will ride every sea. The object of the voyage is to test its utility. They will visit England and go to the World's Fair at Paris. The raft was spoken when about 170 miles out—all hands well.

A CANNON was recently manufactured at one of the foundries at Grass Valley, according to the *National*, out of an old 8-inch shaft—the bore being 1 1/4 inches in diameter and fifteen inches in length. After being bored, it was put into a lathe and turned and polished. If we are not mistaken, this is the second cannon manufactured in Grass Valley.

THE ARRIVALS and departures by sea from San Francisco for the six months ending July 1st, were as follows: Arrived, 16,488; departed, 8,300—showing an increase of 8,188; nearly one-half the arrivals being a permanent addition to our population. Of this increase about 2,000 were from China.

A NEW LIGHT-HOUSE is to be erected at Cape Mendocino. The tower will be constructed of iron, and the lens of the first order of Fresnel, revolving at an interval of thirty seconds. The foundation of the tower will be 360 feet above high water mark. It will be lighted about the middle of November.

**BESSEMER STEEL WARE.**—Bessemer steel is now used in the manufacture of ordinary iron cooking utensils. All kinds of hollow ware for domestic purposes, are now made of this material. They are pressed into shape from a flat plate very much as bonnet shapes are pressed, and are of course turned out without seam or rivet. The superiority of steel over cast iron as a conductor of heat, as well as its increased strength for a given thickness, and many other considerations, render this description of iron ware economical at a much higher price than the ordinary ware. The cost of manufacture by this process is much less than the cost with cast iron—the difference being almost equal to the increased cost of steel over iron.

**NEW INCORPORATIONS.**—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

**SCOTT RIVER G. M. Co.**—Siskiyou county, July 10th. Capital stock, \$120,000; 100 shares. Trustees: George Hearst, Joel J. Josselyn, J. W. Pearson, Wm. A. Bolinger, and W. P. Pool.

THE first steam fire engine in China arrived in March last, and has given such satisfaction that several more will soon be ordered. These engines were from the same establishment which has supplied all the steam fire engines in this city.

**COMMERCIAL HERALD AND MARKET REVIEW.**—The first No. of this paper was issued last steamer day. Its appearance is quite creditable.

JACOB SNOW, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street.) takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 16v14t

Persons desirous of obtaining the finest Wood Engravings, can procure them only by having the picture photographed on the block, by  
D. H. WOODS,  
No. 23 Third street.  
16v14t

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty.  
Call and examine the work. Finest quality of artificial work also manufactured. 16v14t

**Gold Bars,** of whatever size, if well cast, assayed for two dollars, at A. P. MOLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint. 15v14-3m

**Brown's Filtering Heater.**—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler—repairs alone. One is in operation of the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to  
AUSTIN A. WELLS, Agent.  
25v14-7

**METALLURGIST.**—A PRACTICAL metallurgist, experienced in all branches of his business, and particularly in the manufacture of TROUGH COPPER, wants employment. His address can be had the office of the Mining and Scientific Press. 25v14-4w\*

**NORTH AMERICA**

215 and 217 Sacramento street.

SAN FRANCISCO.

IMPORTERS AND JOBSERS OF

**WOODEN WARE,**

- Willow Ware,
- Feather Busters,
- Baskets, in great variety,
- Clothes Wringers,
- Brushes, all kinds,
- Paper Bags, all sizes,
- Blacking,
- Ten Pins and Balls,
- Twines for all uses,
- Fish Hooks and Lines,
- Cordage,
- Broom Materials, Stationery, Bale Rope, etc., etc

Having recently enlarged the capacity of our

**PIONEER**

**WOODEN WARE MANUFACTORY,**

To meet the demands of our rapidly increasing trade, we are now extensively engaged in manufacturing

- Brooms,
- Brushes,
- Falls,
- Tubs,
- Keelers,
- Sieves,
- Churns,
- Fruit Boxes,
- Salt Boxes,
- Wash Boards,
- Cheese Hoops,
- Poach Baskets,
- Broom Handles,
- Cheese Safes,
- Curtain Rollers,
- Kegs, all kinds,
- Pastry Boards,
- Butter Molds,
- Butter Tubs,
- Tar Buckets,
- Clothes Frames,
- Barrel and
- Half-bbl Covers,

And many other articles in the Wooden Ware line, of very superior quality, which we offer to the trade at lower prices than the imported article commands in the market.

We are SOLE AGENTS for the sale of

**SHERMAN'S**

**Improved Clothes Wringer**

For the Pacific Coast.

We would call the attention of the trade to the superiority of

**"ARMES' STAR EXTRA BROOMS,"**

Being made from selected materials by the best workmen. They are unequalled for durability, fineness and beauty of workmanship. None genuine except those bearing a star and the fac-simile of the signature of C. W. & G. W. ARMES on the label. Trade mark secured. Parties ordering this Broom should specify "ARMES' STAR EXTRA," to insure their getting the genuine article.

Our customers can always rely upon having their orders promptly filled with goods of superior quality at the lowest market rates.

**ARMES & DALLAM,**

21v14-1am6m9p 215 and 217 Sacramento street.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Works, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats; Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excellent Star double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's lugs, Frater's concentrators, Waklee's pans, Beers' pan, Ceraman Barrels, Arastra, Gearing, Chile Mills, Settlers of all descriptions, Sectors of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Fans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**DRILLING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

R. J. BOOTH. GEO. W. FRISCO. IRVING M. SCOTT  
24712 **H. J. BOOTH & CO.**

**A New Silk Fiber.**—An Eastern paper says: "The Department of State has received information from the United States Consul at Lambayeque, Peru, that an important discovery has been made in Peru of the silk plant. Preparations are being made to cultivate it upon an extensive scale. The shrub is three or four feet in height. The silk is inclosed in a pod, of which each plant gives a great number, and is declared to be superior, in fineness and in quality, to the productions of the silkworm. It is a wild perennial, the seed small, and easily separated from the fiber. The stems of the plant produce a long and very brilliant fiber, superior in strength and beauty to the finest linen thread. Small quantities have been woven in the rude manner of the Indians, and the texture and brilliancy is said to be unsurpassed."

**HOW TO DETECT ADULTERATED QUICK-SILVER.**—Mercury is often found in the market fully adulterated with lead, tin and bismuth. Of lead it can absorb, or dissolve, almost one-half of its weight without losing much of its liquidity. This adulteration can be easily discovered by rubbing some of the metal on the open palm; if it soils the skin it is adulterated—if pure, it leaves no trace. Besides, if dosed with lead, it will leave a tail behind—that is, the drops, instead of being globular, will assume an elongated form, and a more or less flattened surface.

**TOUGH WOOD.**—It is said that the white nut pine of California is the only kind of tree on the Pacific coast which will afford a wood tough enough for ox yokes. The Indians manufacture their bows from a species of yew, which is found in the deep cañons of the Sierra Nevada.

**DIVERS at work in Boston Harbor to get the sunken yacht Wave out of the channel** have recently found two of the women who were drowned when she went down, clinging to the rigging, holding on with a death grip. Had they let go they would have come to the surface, and might have been saved.

**TOWNE & BACON,**  
Book and Job Printers,  
Have the Largest Office,  
Do the most work,  
And do it better  
Than other offices  
In this City,  
**536** Try them  
With a Job,  
And you will be  
Satisfied the above  
Statements are facts.  
Their office is at 536  
Clay St., below Montgomery,  
Over Pacific Fruit Market.

**Machinists and Foundries.**  
**PALMER, KNOX & CO.,**  
**Golden State Iron Works,**  
Nos. 19, 21, 23 and 25 First Street,  
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF  
**MACHINERY,**  
**STEAM ENGINES AND QUARTZ MILLS**  
DUNBAR'S IMPROVED  
**Self-Adjusting Piston Packing.**  
Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

**WHEELER & RANDALL'S**  
**NEW GRINDER AND AMALGAMATOR**  
HEPBURN & PETERSON'S  
**AMALGAMATOR AND SEPARATOR,**  
**Knox's Amalgamators,**  
WITH PALMER'S PATENT STEAM CHEST,  
Superior for working either GOLD OR SILVER ORES, and is the only Amalgamator that has stood the test of seven years' continual working.

**Genuine White Iron Stamp Shoes and Dies**

Having been engaged for the past ten years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10qy-tf

**WILLAMETTE IRON WORKS,**

**Superior Workmanship**  
of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.  
Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 25v12-3m

**OLD PROPELLING POWER REVIVED.**—A method of propelling boats, now in use in France, has been introduced upon the Erie Canal at Buffalo, New York. By this system, a steel wire, five-eighths of an inch in diameter, is laid along the center of the entire length of the canal. This wire cable runs over a drum on the deck of the boat, and a small engine of four-horse power turns the drum, and the boat is thus drawn along. It is claimed that a boat of two hundred and fifty tons may be pulled along in this way at the rate of two miles per hour, with a consumption of only twelve hundred pounds of coal in twenty-four hours.

We alluded to this re-invention several weeks since, as a very old idea, but nevertheless a very useful one.

**GREAT YIELD OF QUICKSILVER.**—Twelve and three-quarters tons of cinnabar ore, from Chapman's mine, three and a half miles south of San Jose, yielded sixty-four flasks of quicksilver, valued at three thousand dollars.

**WE ARE NOW OFFERING OUR IMMENSE STOCK**

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

SALT is now being manufactured in Alameda county on a larger scale than ever. Seventeen companies are now engaged in the business, employing about eighty persons. It is expected that 15,000 tons will be produced this season, for which a ready market is found in this city, at remunerative prices.

SECOND.—Chladni found that the velocity of sound was from ten to sixteen times as great in wood as in air. In metals the velocity is between four and sixteen times that of air.

BULLION FROM BELMONT.—The Reese River Reville, of July 6th, notices the arrival at Austin of two bars of bullion from the Belmont Mining Company.

The wheat harvest has fairly begun in Illinois and Indiana, with a prospect of the largest crop ever gathered.

SEVERAL cases of a new disease, bearing some resemblance to hydrophobia, have occurred among the cattle, hogs and dogs in the vicinity of New Market, Va.

New Mining Advertisements.

Chilpanena Mining Company--District of Ores, Sonora, Mexico. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of July, 1867, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 313 California street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twelfth day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth (5th) day of August, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. JOHN F. LOHSE, Secretary. Office, 313 California street, up-stairs, San Francisco. jy13

By order of the Board of Trustees. N. C. FASSETT, Secretary. Office, N. E. corner Front and Clay streets, San Francisco. jy29

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

Machinery.

STEWART'S CELEBRATED HINGED Grinder and Amalgamator.

Is the Cheapest and Quickest Pan Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the muller to better advantage than any other Pan in use...

VARNEY'S PATENT AMALGAMATOR. These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been or will be, spared to have them constructed in the most perfect manner...

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION! The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others...

NELSON & DOBLE, AGENTS FOR

Thomas Firth & Sons' Cast Steel, Files, Etc., Shear, Spring, German, Plow, Blister and Toe Calk Mills, Flour Mills, Saw Mills, and Manufacturers of Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools...

SAN FRANCISCO BRUSH FACTORY, No. 211 California st., manufacturers to order all kinds of BRUSHES.

At lower prices than cost of Eastern Importation. Brushes for all classes of machinery. A superior Scrubbing Brush from Soap Root Herb, also Sluice Brushes from the same material. The Patent Bristle, Street, Stable, Flue and Plume Brush, for which they have the exclusive right for the Pacific Coast.

ROOT'S PATENT FORCE BLAST BLOWER.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 per cent. less power than any Blower now in use. For further particulars, address KEPP, BLAKE & CO., Stockton; or Wm. T. Garrett, corner Mission and Fremont streets, San Francisco.

To the Mining Community.

THE UNOBSERVED, WHO HAS HAD FIFTY YEARS constant practice in superintending mines, is now prepared to inspect and report on Mines and Mining Properties, and advise as to the management of the same. Office, 851 Harrison street, San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this improved Machine for Breaking or Shelling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction...

The arrow on the fly-wheel shows the direction to drive the eccentric, which in combination with the link, D, gives the movable jaw, E, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the Rawhide Ranch Mine, in Tuolumne County: RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866. JAMES BAODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations...

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the Mining and Scientific Press, of September 29th, 1866.

LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALED in the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Bore Mills, and Manufacturers of Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools...

\$85 for Hunter's Improved Concentrator.

The patentee is prepared to sell his Concentrators for the above price, and guarantees, when the machines are run according to directions, to give 20 per cent. better results than from any Concentrator built on this Coast, and will refund the money if they will not perform what is claimed for them. Machines with copper plates, will cost \$10 extra. The Machine can be seen in operation at Both & Co's Union Foundry, up stairs. Parties purchasing Concentrators will do well to examine before buying others of pretended merit.

FOR \$50. HUNTER'S BUREKA AMALGAMATOR.

For sale, the right to build and use in mills. A working plan will be furnished each purchaser. Five machines can be seen in operation at the Eureka Mill, Grass Valley. The cost of the tools for the machine, without the iron-box, is about \$100. The box will answer of wood. By reference to the Mining and Scientific Press of May 25th, a full description of the above Machines may be found. For particulars, send for Circulars, or address ANDREW HUNTER, Union Foundry, San Francisco.

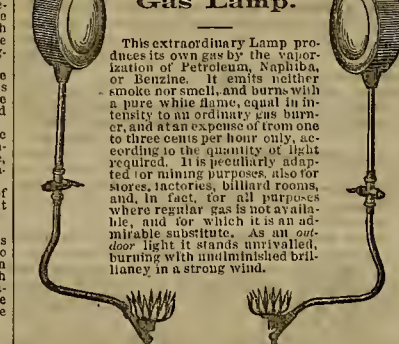

HEALTH! HEALTH!

Taylor's Stench Traps and Garbage Baskets.

To prevent this, purchase one of Taylor's Stench Traps and Garbage Baskets. And promote the health, comfort and cleanliness of your family. (For description see Mining and Scientific Press, April 6, 1867.) Sold wholesale and retail by TAYLOR & SONS, at No. 429 Pacific street, San Francisco. 15v14tr

THE CELEBRATED Self Generating Portable Gas Lamp.

Directions for Use. Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 15v14-5p

MECHANICS' INSTITUTE. Resources of California.

THE MECHANICS' INSTITUTE of San Francisco, hereby offer a PREMIUM OF ONE THOUSAND (\$1,000) DOLLARS for the best Essay on the "RESOURCES OF CALIFORNIA, AND BEST METHOD OF DEVELOPING THE SAME," under the following conditions: One-half of the premium in cash on the certified award of the Committee of Judges, and the balance from the first proceeds of sales of the successful work, which is to belong to, and will be published by, the Institute.

The Essays are to be handed in to the Librarian of the Institute on or before the FIRST DAY OF JUNE, 1868, and the award will be made by the Judges at the opening of the Industrial Exhibition, which is to be held in August or September following. The Essay should be divided into three great heads, viz.: Mineral, Agricultural and Industrial Resources, with proper subdivisions of each subject. It should be sufficient in quantity to form a duodecimo (12mo) volume of from 250 to 300 pages long primer type, solid.

Writers will sign their articles in cypher, and send their names and address in sealed envelopes, which will be kept in a secure place by the Institute, and only be opened when the award is made. The manuscripts of unsuccessful writers will be returned to them without publicity. The Committee of Judges have the right to reject all Essays in case they do not consider them worthy of publication or the premium. No further instructions than are contained in this advertisement will be given to this Committee, nor will they be subjected to any advice from the officers or members of the Institute in regard to their proposed action. All manuscript submitted must be in clear legible writing, so as to admit of easy reading.

GUN COTTON IN THE MINES.—The Territorial Enterprise speaks as follows of an experiment with gun cotton in the Gould & Curry mine:

The hole was twenty-eight inches in depth and about an inch and a quarter in diameter, and was charged with six inches of gun cotton. The report of the blast was not so loud or jarring as would have been that of even a less quantity of gunpowder; but the amount of rock displaced was quite as great as though gunpowder had been used. Now, however, we come to the great advantages to be derived from the use of the gun cotton in blasting in the lower levels and long and badly ventilated drifts of our mines. The instant after we heard the sound of the explosion we were able to return into the drift and note the execution done, not suffering the slightest inconvenience from smoke; whereas, had the hole been charged with gunpowder, we could not have gone in until after the lapse of at least fifteen minutes, and then would have found the back part of the drift so filled with smoke that we could hardly have distinguished the body of a man at a distance of six feet. The explosion of gun cotton produced much less heat than is produced by the same or much less quantity of gunpowder. This is a fact worthy of consideration to those mining in the hot and badly ventilated chambers of the lower levels of our mines.

Two other blasts were tried in another drift, which did not succeed, on account of the gases finding an exit through the seams of the rock—the tamping, even, not being blown out; such cases, however, often occur with powder. Gun cotton is to be thoroughly tested in this mine, and we will have more to say of it ere long. It is being successfully used, and is much liked, in the Belcher mine at Gold Hill. Gun cotton is now compressed, so as to occupy much less space than that ordinarily used—thereby effecting a great saving in drilling, by making a smaller hole do as much execution as a larger one. We presume that in the above experiments the ordinary gun cotton was employed.

RAILWAY MANAGEMENT IN INDIA.—A correspondent of an American paper, writing from Calcutta, and speaking of the Delhi railroad line, says that during last year seven or eight corpses were taken from the cars, victims of over-crowding. Men and women, it says, are so crushed and crammed into the third-class carriages as to be forced to remain standing for the whole length of a journey, reaching sometimes 400 or 500 miles, in the hottest season of the year. A more rude and barbarous system of railroad management could scarcely be conceived than the English practice of locked cars, without any means of communication between the passengers and engineer or conductor during the transit from one station to another.

ELECTRICITY IN IRON SMELTING.—The American Artisan, in alluding to the recent application of electricity to iron smelting in England, which was also noticed in the Press of June 29th, says:

This may be a novelty in England, but the records of the United States Patent Office will show that more than one American inventor has proposed substantially similar applications of electro-magnetism in the manufacture of iron and steel. We have in mind particularly the application made several years ago for a patent by Prof. A. L. Fleury. As, however, nothing has resulted from any of these American inventions, we caution our iron manufacturers against attaching too much importance to the above statement.

A MOHAMMEDAN LAWYER.—Budrooden Tyaree, a Mohammedan, has been admitted to practice at the English bar. He was sworn on the Koran. He intends to practice at the bar at Bombay, and will be the first member of the bar in India who is a disciple of the Prophet.

A CORRESPONDENT of an agricultural paper writes as follows: "If any of your readers that cannot raise radishes on account of worms, or unsuitable soil, will strew common wheat bran, one inch thick, on any good soil, and hoe it in, and then plant their seed, they may eat as good radishes as anybody can raise."

**GETTING READY FOR THE ATTACK.**—Two of the big 20-inch guns from the Fort Pitt Foundry have been cast to the order of the Chilean Government. Four 15-inch guns, and others of less caliber, from the same foundry, have already been shipped for Chile. It is more than probable that the Spanish fleet will receive a still warmer reception than at the time of their last attack when they next open their batteries upon the spunky South American Republics.

**PROFITABLE MINING.**—The Levant Mine, Cornwall, commenced working in 1820, since which time copper and tin ores to the amount of over \$5,000,000 have been returned; dividends to the extent of somewhere about \$1,000,000 have been declared. The largest amount of profit made at any one time was \$21,800, divided in two months. Two of the levels extend beneath the Atlantic ocean, about three-quarters of a mile. The engine-shaft is now about 1,700 feet deep from the surface.

**A SECTION WELL,** something on the principle of driving hollow iron tubes into the ground, as practiced somewhat extensively in this country, has been patented in France. A well is dug and closed in air-tight. On exhausting the air, the water currents flow in from their remote connections with considerable force, by means of which the flow of water is considerably increased.

**NEW WAY TO MAKE POTASH.**—A process, hitherto confined to the laboratory, has been introduced, on a practical scale, by M. Tessié de Mothay, advantageously replacing sulphuric by fluosilicic acid in the manufacture of potash. The acid is obtained from carbon, silic, clay, and fluoride of lime, melted in a blast furnace.

**UNDERGROUND TRAVELING** in London increases at an astonishing rate. The number of passengers carried for the first half of the present year by the Metropolitan underground railway was 16,503,395, against 5,823,437 in 1863 and 7,462,283 in 1865.

**THE first woolen factory** in Minnesota was established by a woman whose husband had left her seven children and not a dollar, to go and seek his fortune in California. When he returned, penniless, her factory was running and she was proprietor of a small town.

**Quartz Mill Construction and Superintendence**

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a quartz mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in sawing sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address P. M. SIAW, San Francisco, care Mining and Scientific Press. 26v143m

**HINKLE & CAPP'S CENTRIFUGAL ORE GRINDER AND AMALGAMATOR.**

Patent dated April 16th, 1867.

For Grinding and Amalgamating Charges of Ore.

Arranged as shown in the first engraving, the pan is adapted for grinding and amalgamating separate charges of ore of 800 lbs. each, doing its work rapidly, thoroughly and effectually.

This sectional engraving exhibits more clearly the arrangement and shape of the grinding parts of the machine. It, and the other engravings, will be more clearly understood by reference to the accompanying explanation.

Half Section or Top View.

**The Centrifugal Ore Grinder.**

This new GRINDER and AMALGAMATOR is extremely simple and compact in its construction. The principle availed of is entirely novel. The grinding is effected by perpendicular millers, pressed laterally by centrifugal force against perpendicular iron dies, fitted to the inner sides of the pan. It is to be run at a speed of from 60 to 30 revolutions per minute, according to the hardness of the rock to be crushed. The pressure upon every part of the grinding surfaces is direct and uniform, and they wear with straight and true faces from first to last, conforming also to the shape of the sides of the pan, so that the work performed with old millers end plates is as thorough and perfect as with new ones. The pulp enters readily between the millers and side dies, the pressure being light in front and heaviest at the heel of the miller, there is no strain upon any of the parts, and no liability to breakage or disarrangement, and no wear except that which is useful on the grinding surfaces. The work done is performed without jarring, jerking, straining or clogging, with extreme regularity and evenness, the pulp being of great and uniform fineness. It is not liable to be clogged, nor to be obstructed, stopped, impeded or broken, by coarse pieces of rock, pick points or iron, accidentally introduced with the crushed ore, as these can readily pass each miller separately, without interfering with or affecting the other millers, each of which is independent, or can rest upon the bottom below the millers, without inconvenience, as the arms play freely an inch above the bottom of the pan. It is more readily cleaned up than any other pan, as each miller can be lifted out separately by hand, and there is no necessity for lifting the revolving cone or driver, which is also easily turned, there being no friction when not in use, or rapid revolution. The bulk of the mercury is not ground up with the rock, but lies below the lower ends of the millers in a groove, and in another groove on the cover of the pan, where all the pulp and metal passes continually over it without cutting or carrying it away. The millers and side

For Grinding and Discharging Continuously.

Arranged as shown in the second engraving, all the interior grinding parts being the same as shown in first view, this pan is adapted for receiving and grinding and discharging continuously crushed quartz as fast as supplied by a five-stamp battery, with No. 4 or 5 screens. A "sluicer," or some similar contrivance, to carry off the clay, slime and surplus water, is to be placed between it and the battery.

EXPLANATION.—E, miller-hanger; F, miller plate or shoe; O, side die; H, supporting lip; B, bearing surface; P, feeder; X, weight to counter-balance wear of miller plates, or shoes; U, cover used in working charges of ore. The dark shade on the bottom of the pan represents one of the grooves for mercury.

These dies are easily removed at any time, or when worn out, and an extra set of millers is furnished with each pan sold. It is also adapted for grinding cement, sulphuric, roasted ores, &c. We claim all these advantages for our Pan, and that it will do more and better work, with less power, and less attention and manual labor, more rapidly and with less expense, than any other pan or miller made for the same purposes, and claimed to be of equal or greater capacity. We will sell them for use on condition that if, when fairly tried they fail to answer these promises, they may be returned.

**Hinkle & Capp's Centrifugal Ore Grinder and Amalgamator**

May be seen in operation, and examined, at the European Metallurgical Works, on Bryant, between Third and Fourth streets, San Francisco, where all interested in mining and milling operations are invited to inspect it. Its weight, as arranged for continuous grinding and discharge, with extra set of six millers, is about 2,700 lbs.; or as arranged for grinding and amalgamating single charges of 500 lbs. of ore, also with extra set of millers, about 3,000 lbs. Price, as above, completely fitted and ready for use, either way, \$500, gold coin.

For further particulars, apply by letter to PHILIP HINKLE and CHARLES S. CAPP, No. 513 Clay street, below Montgomery, San Francisco, Cal. or personally to the above, or S. P. KIMBALL, Esq., at the European Metallurgical Works, on Bryant street, between Third and Fourth streets, or at the Miners' Foundry, First street, near Folsom, where they are manufactured.

Send for Circulars. PHILIP HINKLE and CHARLES S. CAPP, Patentees, 513 Clay street, San Francisco. 25v14 1f

P. COLE & CO.

E. O. HUNT, Manufacturer of Windmills, Horse-Powers Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS have all the sails so arranged, as to turn edgewise to the mill when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person. HUNT'S SELF-REGULATING MILL is strong, durable and cheap. It is provided with means for stop- ping, in the most violent winds. This mill is well known through- out the State. Tread Horse-Powers, Sump Horse-Powers, Pumps in great variety, Single and Double-Acting. Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Tanks built to order. No. 28 Second St., and 108 and 110 Jessie St. 2v15qy San Francisco.

Greatest Invention of the Age. BOWMAN'S AMERICAN WASHING COMPOUND And housewife's true friend, saves one-half the labor, one-half the time, and one-half the expense. For WASHING CLOTHES, CLEANING HOUSES, REMOVING PAINT, GREASE, etc., it is unequalled. It makes hard water as soft as rain water. For sale at \$1.50 per can of five gallons, at the manufac- tory, 222 Jackson street, near Battery. Please send your orders, by mail or express, to LYNCH & PARSONS, 25v14-2am6t San Francisco, Cal.

Gaston's Screw Grinder and Amalgamator

The Best Yet Invented.

For rapidity and thor- oughness of work, the ma- chine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, repre- sents open spaces through the base of the cylinder, and F, inclosed partitions filling (at those points) the spaces between the cylin- der and the shell of the pan. These inclined parti- tions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the cotter again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floored in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in en masse, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is effectually rubbed by the shoes, while the screw, being constantly fed by the pulp from above, it presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force to the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmeo! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

Important Notice. Another New Doctor in the Field!

DR. H. A. BENTON, Has been performing many wonderful cures in this city the past two years, and, as his practice is fast increasing at the office, he finds it difficult to attend all the outside calls, and has concluded to invite R. H. OLMSTEAD, M.D., to join him. Dr. Olmstead, of Napa City, has been eighteen years successfully treating obstinate cases with water, electricity, and the magnetic forces. Remedies of the Eclectic School, of which he is a graduate, can be resorted to when needed. Being the seventh son of a celebrated physician, and at the same time having a powerful organization, his magnetic hands like magic dispel pain and disease. He is also a nat- ural bone-setter. Dr. Olmstead has this day associated with Dr. H. A. Benton, the Medical Electrician and Homeopathist, at his office, 314 Bush street, San Francisco, who, having all the necessary facilities, such as the patent Electric, Chemical, Sulphur, Vapor, Hot Air and Medicated Baths, which aid in curing all curable diseases, whether acute or chronic, and with the combined skill, together with an excellent lady assistant, gives an assurance of cure to many, benefit to all, and injury to none. N. B.—Terms for treatment within reach of all. Office hours: from 9 A. M. to 8 P. M.; Sundays, by appointment. Lodging rooms convenient for those who come from the country. June 1st, 1867. 22v14-eow4t

LACOUR'S SARSAPARIPHERE BITTERS

Have so speedily grown in favor that their unrivalled sale has attracted remarks and criticism of the trade. Jealousy attributes their success to the fineness of their general style, and principally to the originality and beauty of the bottle, which was conceived and manufactured by California artists. MR. LACOUR, an energetic promoter of California resources, desired to show that California has no need of being tributary to other countries for talent or mechanical industry. The cause of their success is the great benefit they have been to the large number who have already used them. MR. LACOUR is a graduate of the Polytechnic Institute of France, and adds to a thorough knowledge of Chemistry many years of experience; and, after a long and careful experimental study, has been enabled to offer

LACOUR'S SARSAPARIPHERE BITTERS. They are the most efficient Blood Purifier, because they combine with the wholesome Sarsaparilla, which operates by cutaneous excretions, and other substances which gently stimulate the secretions of the lower glands and organs, render digestion easy, obviate costiveness, and remove regu- larly every impurity of the blood. They are unrivalled as a remedy for Scrofula, Dyspepsia, Constipation, Liver Complaint, Nervous Affections, Colic, Intermittent Fevers, and all diseases arising from impurity of the Blood or Costiveness.

Who Takes Them? The Old Man Takes them as a gentle stimulant and mild rejuvenator. The Young Man Takes them to regulate his system, prevent disease, and stimulate to new life his overworked body. The Young Woman Takes them to secure regularity in her habits; to tint her cheeks with the bloom of health, to give a sparkle to her eyes, and sweetness to her breath. The Husband Takes them to promote vitality, give strength to the body, peace to the mind, and with his health, wealth and comfort to all his family. The Wife Takes them to invigorate and strengthen her system, and as an aid to nature in regulating her periodical sickness. Children Take them as a gentle, yet effective tonic. The Dashaway Takes them as a mild, pure stimulant, containing none of the deleterious, essential and tussiloid of forbidden drinks. The Inebriate Takes them to give tone to his poisoned stomach and allay the fearful longings for strong drink with a stimu- lant that does not madden or destroy. The Traveler Takes them to prevent sea sickness, and secure his health against change of climate.

Everybody Takes Them! PRO BONO PUBLICO! 2v15-6m

Perry Davis' Vegetable Pain Killer. The universal remedy for internal and external complaints. At this period there are but few unacquainted with the merits of the Pain Killer; but while some extol it as a liniment, they know but little of its power in easing pain when taken internally, while others use it internally with great success, but are equally ignorant of its healing virtues when applied externally. We therefore wish to say to all that it is equally successful, whether used internally or ex- ternally, and its sale is universal and immense. The demand from India and other foreign countries is equal to the demand at home, and it has become known in those far-off places by its merits—the proprietors have never ad- vertised it or been to any expense in its introduction into foreign lands. Sold by all Medicine Dealers everywhere. 2v15-1m

W. T. GARRATT, City BRASS AND BELL FOUNDER. Cor. Mission and Fremont sts., SAN FRANCISCO. Manufacturer of Brass, Zinc, and Anti-Friction or Babbet Metal Castings: CHURCH AND STEAMBOAT BELLS, TAVERN AND HAND BELLS AND GONGS, FIRE ENGINES, FORCE AND LIFT PUMPS, Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder, and Copper Rivets, &c. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles, HYDRAULIC PIPES AND NOZZLES For Mining purposes, Iron Steam Pipe furnished with Fit tings, &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Pat- ent Improved Journal Metal." Highest Market price paid for OLD BELLS, COPPER AND BRASS. 61r

JOHN G. HODGE & CO., Importers and Dealers in STATIONERY, Blank Books, School Books and Cheap Publications. WRAPPING PAPER, PAPER BAGS, ETC. Nos. 418 and 420 Clay street, San Francisco. Special attention given to orders from Country Mer- chants. 2v15-qr16p

Golden City Chemical Works. LABORATORY, Corner of Seventh and Townsend Streets. OFFICE, Corner of Montgomery and Bush Streets. CAPITAL STOCK, - - - \$500,000

Trustees: H. P. WAKELEE, THOS. H. SELBY, NICHOLAS LUNING, THOS. BELL, CHAS. E. McLANE. H. P. WAKELEE.....MANAGER.

THIS COMPANY ARE NOW PREPARED TO FURNISH Sulphuric, Nitric and Muriatic Acids of superior quality, in quantities to suit. Orders will be received at the office on'y for Chemicals of every description, which will be manufactured as may be required. The Company beg to say that they have the ad- vantages of all improved machinery and apparatus for the manufacture and manipulation of these products, and our Laboratory is fitted up with the most recent improvements which experience and science suggest, and is surpassed by none in completeness and perfection for the purposes it is designed. 9v14-3m

Foundry for Sale. A One-half Interest in the UNION IRON WORKS, SACRAMENTO, Owned by William R. Williams, is offered for sale on the most favorable terms. A Good Bargain May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establish- ment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 85 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets. Inquire at the office of the Foundry, or address WILLIAM R. WILLIAMS, Sacramento, Cal. 25v13trf-16p ELECTROTYPING CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, orna- ments, and other embellishments to suit the various branches of industry in this State.

reel is made stronger, as there is nearly double the number of spokes that are usually employed.

The pin upon which the fly-wheel runs is made fast to timbers that rise vertically and in a diagonal direction with the foundation timbers, which, by crossing and bracing each other, are made very strong and rigid. Upon the top of these diagonal pieces is placed a timber, held in position by screws passing through its end. From this timber is suspended a swing-pulley, which holds up the chain as it comes off the reel, and a joint at the end of the arm that supports the pulley enables it to accommodate itself to the different degrees of slackness which are occasioned by the chain passing around the reel on the different-sized wheels placed upon the fly-wheel. At the one end of the frame, bent downward and sustaining the aforesaid pulley, is a lever, which acts as a spring, and which is held by the foundation of the machine, and is connected to the arm of the pulley by a chain, and is thus kept at a degree of tension. For a less speed and a stronger power a larger wheel is placed upon the fly-wheel hub, and for a fast speed, and where a strong power is of secondary importance a smaller wheel is

## Telegraphic Communication with Mines.

It will be recollected that we made mention, some time since, of an ineffectual attempt to secure telegraphic communication between the interior of the Pewahic copper mines, at Lake Superior, and the superintendent's office, on the surface. For some unexplained reason, it was said the current could not be established, although various devices were used. The further extremity was inserted in moist ground and in a pool of water, the whole length carefully insulated; but all to no purpose. A single wire was used. A double wire would undoubtedly have succeeded; but the effort was made to solve the question whether a single wire, with a good ground connection, could be made to work as well between the interior of a mine and the surface as along the surface of the earth. Our correspondent, "F. A. H.," of Forbestown, suggested at the time that the difficulty might arise from a

considerably interfered with by the loss of time in communicating the required signals. Mr. W. H. Brain, the engineer, has introduced the electric telegraph, by which signals are at once transmitted to the engine house, and the words "go on" and "stop" are instantly brought into view. The instrument was made by Mr. Izant, of London. We are not advised as to whether a double or single wire is used by Mr. Brain.

## Gold and Grain.

The rapid growth of the agricultural interest of this State cannot but be gratifying, in the highest degree, to every true Californian. Important to ourselves and to the world as are our mining interests, the indications are that California, as a State, will eventually be more famous for her grain than for her gold. Gold will eventually be dethroned in California, and corn become our king; nor need we be despondent at such a foreshadowing. With improvements

in mining processes and constant discoveries of new mines, our gold products will more than hold their own; while our broad and fertile valleys will soon be taxed to their utmost to feed the countless numbers which will, ere long, look to us from Nevada, Arizona and Northern Mexico, to say nothing of islands of the Pacific and the western coast of continental Asia, for that "staff of life" which, since the world began, has ever sustained and nourished the toiling millions who make up the mighty mass of humanity. In the meantime, of our abundance we are feeding the inhabitants of the States and countries bordering upon the eastern and western shores of the Atlantic. High prices enable us, for the present, to take advantage of such distant markets.

Ten millions of dollars, in round numbers, have been added to our wealth during the past year in the single article of wheat; and, from all accounts, the present season will be fully as productive, if not more so, than the past. Heretofore it required nearly the entire product of our mines to feed and clothe us; but now, by means of our increased agricultural yield, we have a surplus of gold for investment, whereby our material wealth is being rapidly increased. Agriculture, after all, is the real wealth of a people. It has been aptly termed the steward which spreads the daily table of mankind. And what a table is being presented to us of the Pacific coast! a demand to which the valleys of California must by-and-by respond. Let us plow wider and broader; let us multiply our granaries, and heap them to the brim; let the idle loiterers in our city streets lay hold of the plow and the reaper, and transform their feeble limbs and pale cheeks into stalwart arms and sunburnt faces; let them drop the yellow grain into the earth, and by-and-by they will reap a golden harvest, richer and more easily gained than the miner wrests his glittering grains from the flinty rocks of our mountain heights.

## Starr's Patent Horse-Power.

The increasing demand for, and great usefulness of small motive-powers, for various purposes, has of late called into exercise much inventive talent in the way of meeting this especial want. For general convenience and readiness, probably nothing is superior to the horse for supplying this want. His domestic nature, his great muscular strength, and general adaptability for various other useful purposes, render him a most fitting medium for the obtaining of small power, especially where that power, as often happens, is wanted at different localities and at infrequent intervals. Many devices have been invented by which the power of the horse can be most advantageously transferred to the movement of machinery, among the best of which we find the one herewith illustrated, and which was first described in the *American Artisan*. This invention was patented by Nicholas Starr, Jr., of Homer, N. Y., May 1, 1866. We copy the following description of the invention from the *Artisan* of Feb. 27, 1867:

It is operated with a chain which extends around the reel as the means of communicating the necessary motion. Upon the foundation frame-work of the machine are placed friction-wheels or rolls, upon which the reel rotates. The reel is made by placing the spokes or beams in pairs near each other in a central hub, radiating outward, and each pair connected by cross-pieces projecting beyond the point of connection with such spokes, and putting upon the outer ends of each cross-piece a forked catch, in which the chain passes. These cross-pieces are equal in length to the space between the catches and the different cross-pieces, so that the catches shall be equidistant around the reel. To strengthen the reel, iron rods connect the different cross-pieces, one of the rods being formed with a swivel, by the turning of which the whole series of rods between each cross-piece is made very tight. In this arrangement space is obtained between the different pairs of spokes for the horses to travel, and the

used. The fly-wheel, with the attached small wheel, runs upon a section of a cone with its base outward; and this cone screws into the pin, so that if the fly-wheel or cone

wears, by turning the cone in the pin the point made by the cone and the fly-wheel is made as tight or close as is desired; the base of the cone being outward, it prevents the fly-wheel from running off. The chain which passes around the reel and is held in place by the catches at the ends of the arms of the reel, passes over the swing-pulley and then over the wheel upon the fly-wheel shaft; and by its peculiar form or sprocket-shape (see Fig. 2) the wheel is embraced by the chain, which thus gives the requisite motion to it and the fly-wheel, and from thence the motion is communicated by any customary means where it is required.

supposed difference in the electric tension between the surface and interior of the globe. His argument was, that as in a spherical body, the distribution of free electricity is superficial—every portion being electrified alike; so with the earth, which is only a larger sphere, the loss of the current at any considerable depth would seem to indicate that the free electricity of our globe is also confined at or near to the surface. The correctness of the philosophy of our correspondent is not at all improbable. Our object, however, in again referring to this subject is to note the fact, gleaned from an English journal, that the electric telegraph has been successfully introduced into mining operations in England, by means of which a serious impediment has been overcome. The shaft of the Trafalgar company, in the Forest of Dean, terminates on the vein of coal; from thence the coal has been worked on the "dip," leaving a formidable incline for the coal wagons to ascend, and increasing the cost of working. A steam engine was erected on "the bank," to reduce the expense of haulage and to increase the dispatch. Its usefulness was

STARR'S PATENT HORSE-POWER.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

## The Reese River Country and its Mines.

BY A. J. HOWK.

[Continued from Page 18.]

## A REVIEW.

Since my last letters were written, I have revisited a part of the country previously noticed. At Ophir Cañon I found the Murphy mill in full blast, while from the mine the richest ore was being raised; very beautiful specimens of the most intense blood-red ruby ore were shown from the lower levels. Powerful steam hoisting works have just been put in motion to raise the ore and the increasing volume of water from the mine; considerable hoisting is in progress and the town every way gives evidence of the highest state of prosperity.

Next, at Northumberland, I found Wm. N. Cummings, with a considerable force of men, at work on the Northumberland lode. This fine mine is likely to prove one of the richest in Central Nevada. It is much broken at and near the surface, owing to its situation, in close proximity to the base of a high mountain. A tunnel is being run, which is expected to reach the lode where it has not been disturbed. Several valuable mines have been discovered in this district since my former visit; among them the "Clara" and "Branch" lodes in the southwestern part, and the "Silver Bar," in the central part, are the most promising. At Belmont all is life and bustle; such preparation as can be made in advance of machinery and lumber on the works of the immense mills to be erected here this summer, are in progress. The town is growing rapidly; but like most new places, keeps somewhat overdone by those who rush thither in anticipation of its great future.

Eastward, through Alatoona Pass, our next camp was with Messrs Clark & Co., who are constructing the new toll road to the "Lower Country." The grades on this we found nearly completed, and remarkably easy for such mountains as the Danville Range appear, when viewed from the valley. This direct and central route has been greatly needed for the travel eastward from Belmont to Hot Creek, Empire, Reveille, Pabranagat, and the lumber region in the White Pine range, which lies about forty miles east of the Hot Creek or Diamond range. In Hot Creek Cañon, the owners of the immense lode, called the "Indian Jim," are exploring it by a vertical shaft and drifts from the bottom. Three miles south—but at least five miles from the trail—situated in the limestone belt which lies immediately west of the great quartzite upheaval of this range, we find the "Gazelle" mine. This is located on an accessible slope of the mountain, midway between Old Dominion and Rattlesnake cañons, well up towards their heads. Here we were hospitably entertained by Mr. Irvin, the superintendent and part owner. The mine presented, on the day of our visit, the richest sight in the mineral line that we have thus far seen in this wonderful region. The lime cap had just been removed from the lode, showing a body of astonishingly rich ore twelve feet wide; that portion next the foot-wall being of copper-silver glance, more or less massive through a width of ten feet, while eighteen inches or two feet, next the hanging wall, was of chloride ore.

The Gazelle has its duplicates, by the score, all through these mountains, from Mammoth on the west to Pabranagat on the east—mines that are scarcely ever heard of outside the district where they are located, and not set forth by the high-colored, glowing reports of paid experts (so-called) who have well nigh ruined the country and retarded its progress quite five years. How-

ever, it is gratifying to see that the day of the latter is past, and that plain, sensible, practical men are sent out, or employed here by companies organized at the East. One really interested in the permanent welfare and prosperity of Nevada, can but deplore the great injury wrought to the country, and the ruin to so many Eastern companies by unscrupulous agents, or rather rascally middle-men. All the mining companies organized at the East could, and can yet secure mines for a title of their value, that will place their success beyond a doubt or possibility of failure. Again, the limited knowledge that reaches the public through the press of California and Nevada, in relation to the fabulously rich and vast silver region of Central and Eastern Nevada, is deplorable.

While the reports of the Surveyor-General, State Mineralogist, etc., are filled with the details of the mining operations in the western part of the State, which is already over-crowded and its mines in the hands of wealthy companies, few words of cheer are given the struggling and empty-handed pioneers of the interior, who are laying the foundation of the most powerful State of the nation. This is no idle talk; the dullness, if he thinks at all, must see the wealth and inert power slumbering in the depths of Nevada's mountains. It is high time the press of the State should rise a step above local exaltation.

[Concluded next week.]

[Written for the Mining and Scientific Press.]  
American Steel.

## A VISIT TO THE PHILADELPHIA STEEL WORKS.

It is an indisputable fact that with good tools even a poor mechanic can do good work, whereas, with poor tools, a good workman will usually do an inferior quality of work; and to insure good tools, there is probably no one thing so requisite as first-rate steel.

It has heretofore been said, and many have made the assertion from their own experience, that a first-class article of steel, to answer all the most difficult purposes to which steel is applied, could not be made in the United States. This, however, has been proved by experience and observation of the writer, as well as others, to be incorrect. A visit to the extensive establishment of Baldwin, Baner & Co., of the Philadelphia Steel Works, will convince the most skeptical of this fact. Being in Philadelphia, and hearing, in all the large manufactories that we visited, the virtues of their steel enumerated, and wishing to inspect the process by which it was made, the writer paid them a visit, which has enabled him to describe the improvement in the steel which they have aptly named the "Nonpareil."

The works comprise an area of four acres, and are pleasantly situated on the banks of the Frankford creek, about five miles from the center of business in Philadelphia. The situation was selected with great care, by one of the firm, and experience has proved the correctness of his judgment. The creek is navigable all the way up, and it is no unusual sight to see boats delivering coal and iron, while others are taking on steel, to be shipped to distant parts of the country.

The iron is imported, expressly for the firm, direct from Sweden and Norway, in bars one inch wide and one-half inch thick. It then goes through a process by which it is freed from such chemical elements as do not enter beneficially into the manufacture of steel, and which process is known only to the proprietors. The bars are then cut into pieces about two inches long, and are placed in a black lead crucible, holding fifty pounds, along with a small proportion of finely-ground charcoal and some black oxide of manganese. The crucibles are then placed in a large furnace, known as the "melting furnace," and exposed to an intense heat for three or four hours, or until the "melter" decides that the mass has become thoroughly incorporated. They are then withdrawn by a man known as the "puller-out," and passed by him to the "melter," who pours the metal into the iron molds, where it is allowed to cool, after which these pieces are known as ingots.

From here it is taken to a steam hammer, weighing about 1,800 pounds, and "hroke down"—that is, it is reduced to nearly the size that the bars are intended to be when finished. After this, it is taken to the finishing hammer, where it is finished to the proper size, unless the size be very small, when it has to go to still another hammer, much lighter. The ends of the bars are then cut off, to make a double and triple-refined cast steel; and, after being reheated, the steel is ready for market. This is the steel that has given such satisfaction where it has been introduced, and which has, to a great extent, displaced the English steel in the Eastern and Middle States; but we were assured that their improvement, the "Nonpareil," was as much superior to this steel for turning and planing tools, and all other tools requiring a keen cutting edge, as their other steel was to wrought iron.

The peculiarity of the manufacture by which they obtain this superiority consists in a novel process which the steel goes through during the refining, and which expels all the impurities in a much better manner than it has heretofore been possible to do, and which has been introduced by the firm and is known only to them; and so reliable is their process, that they can depend on having a uniformity in the texture of their large and small bars that is not obtained by any other steel works, either in this or any other country. The experiments by which this knowledge was obtained were conducted before they introduced any of their steel into the market, the proprietors being determined not to sell an article that they were not certain could be depended on, and they regulated their standard by the best English steel.

The "Nonpareil," I was assured, and shown numerous certificates to the same effect, would do at least twice the work of the best English steel for saw gummets, turning and planing tools, and also for all other purposes which require a tough and hard quality of steel.

Although comparatively a new establishment, having only been in existence about three years, and the "Nonpareil" less than one year, they are together creating a sensation in the East that bids fair, before long, to build for them the largest reputation as steel manufacturers in the world. The proprietors informed us that they intended to send an agent to the Pacific coast, to bring it more directly to the notice of the engineers, machinists, railroad companies and miners, than it would be possible to do in any other way.

W. H. D.

## Facts About Patent Matters.

NUMBER SIX.

## THE EXAMINATION, APPEAL, ETC.—CONTINUED.

It frequently happens, that a caveat is on file covering the same invention. In that case, the Caveator, is notified to complete his application within ninety days; and if it is then found to be the same as that of the applicant, an interference is declared, and each party notified of the time set for bearing and deciding the same, each in the meantime being permitted to furnish such proof as he can as to the time when he first completed his invention—the opposite party, in all cases, to be notified of the time and place of taking the depositions, and the names of the witnesses. Each party also files an argument, if he so desires. Two or more inventors may also make application for the same thing at once, when, of course, there will be an interference. A remarkable case of this kind occurred in 1849, when seven different parties, from various parts of the country, made application for the same invention—a hollow churn dasher, having a valve in it, for the purpose of pumping air into the cream while churning. So, too, an applicant may ask and have an interference with a patent already issued. In all cases of interference, the patent is awarded to the party proving himself to be the *prior* inventor, except in those cases where, by his own neglect to apply in time, he is held to have abandoned his invention, as heretofore explained. In case of an interference between an applicant and a patent, where priority of invention is awarded to the applicant, the office has no power to annul the patent already issued, but can simply issue one to the applicant, thus placing him on an equal footing with the patentee, and leaving the parties to appeal to the courts to define and protect their rights.

This is an anomalous state of affairs, which ought not to exist, as it is clearly productive of harm, both to the real inventor and to innocent members of the community. All legislative bodies have the power to repeal or annul any law passed by fraud or mistake. So, too, a court can revoke or annul an order made erroneously.

The Land Office stops the location of a warrant obtained by fraud, and so, too, the Treasury Department stops the payment of a warrant or draft obtained by fraud, or issued by mistake; and it would seem that the Patent Office ought to have the power to cancel or withdraw a patent wrongfully issued. By so doing, it would save the real inventor (and who alone is entitled to a patent) the expense and trouble of going to law to secure what the office has already decided is clearly his. It would also protect innocent purchasers from being defrauded by purchasing rights from the holder of the invalid patent. It would certainly seem that the law ought to be amended in this respect. In all cases of interference, parties have the same right of appeal as in cases of rejection.

When the case is finally decided, it is returned to the Examiner, who endorses it, enters it upon his record, and then sends it to his draughtsman's room, where certain entries are made in his books, after which it is sent to still another room, where the papers are given out to women to copy. They are then engrossed upon parchment, with the thin drawing attached, and signed by the Commissioner of Patents and Secretary of the Interior, after which the seal of the Patent Office is affixed, when the patent is ready for delivery—the applicant in the meantime having paid in his final fee of \$20, he having been notified to do so by the office as soon as the case was passed for issue by the Examiner. By the law of 1863, if a party neglects for six months to pay the final fee above mentioned, he will be considered as forfeiting his right, and a patent will issue to another applicant for the same invention, if one should come. Formerly the whole fee had to be paid in advance; but in consequence of the law of 1861, requiring only \$15 down, the business of the office was seriously impeded by the neglect of parties to pay their second fee and take their patent—nearly a thousand having thus been left upon its hands during one year; hence the provision of law above referred to.

The reader will now have a tolerably clear idea of how patents are obtained, and of the *modus operandi* of preparing and issuing them. It will readily occur to all who have read these articles attentively that the position of an Examiner of Patents is a very important one indeed. It requires a high degree of intelligence, a practical as well as theoretical knowledge of mechanism, and a fair knowledge of law, with strong analyzing and reasoning powers. He should be firm, but free from prejudice, as he has to act in the capacity of a judge—being careful not to deprive the inventor of the smallest even of his rights, and at the same time being careful to give to no one a monopoly of anything which belongs by right to the community, or which is not his invention. To do this, uninfluenced by the personal appeals of applicants and the blandishments of skillful and experienced agents, without giving offence, requires a degree of integrity, firmness and fairness not often found combined in one character. In fact, a hundred times more depends upon the Examiners for the intelligence and integrity with which the business of the office is conducted than upon the Commissioner, who seldom knows anything of the details of the office. The worst feature of all is, that he has the appointment and removal of them at will, and that political influence—not fitness for the position—is what determines their appointment or dismissal; and so, too, of the Commissioner himself; and hence it is you will find a pill doctor examining mills, while a practical mill builder is set to examine tobacco pipes. A lawyer, that probably never drove a nail in his life, has architecture and bridges, while a practical builder of bridges and public edifices is set to examine cook stoves and hoop skirts. And what renders the matter still worse is the fact that by the time they become fairly acquainted with their class and its peculiar duties, they are removed by a change of administration, or to gain favor with some Senator or Member, whose influence the Commissioner desires for some object of his own, and persons entirely ignorant of the business substituted. This is the fault, mainly, of the system, and will never be remedied until the people, and especially inventors, insist upon a change.—W. C. Dodge, in *Prairie Farmer*.

NOVEL ENTERPRISE.—Colonel Robertson, of St. Paul, is importing fruit trees from Russia and Northern China, for the purpose of obtaining varieties that can be grown in Minnesota. Efforts are being made to the same end for this State.

LONDON.—The population of this great city is estimated at 3,080,000.

## Mechanical.

## Russia Sheet Iron.

Few persons are aware of the enormous expense and difficulty attendant upon the importation of Russia sheet iron into the United States, or of the quantity of this material which enters into the various forms of its consumption. The imitations of this iron, which have been from time to time attempted in this country, have hitherto been quite unsuccessful. Although these imitations are often sold for the genuine Russia iron, so near to the genuine are they in external appearance, yet the art of making it stand actual wear, on exposure, is still—unless quite recently discovered—a hidden art to American mechanics.

The indestructibility of Russia iron is most remarkable. Stoves made from it will, with ordinary care, last as long or longer than cast iron stoves, and retain their luster until they are destroyed by an almost imperceptible wearing away, or reduction in thickness of the material.

Some fourteen or fifteen years ago, there was an effort made to get an act of Congress for the issue of a patent for the manufacture of this iron, without spreading the secret of the process on the records of the Patent Office; but, so far as we have learned, nothing ever came of it. Of late it is said that the Perkins Sheet Iron Company, of Providence, have been making Russia iron of a quality equal to the imported article. It is also said that there is a company in Cleveland, Ohio, and another in Portsmouth, in the same State, making about the same quality of iron. The latter is said to be in possession of the true secret of the manufacture, as conducted in Russia, and the only parties possessing it. The secret, it is said, was sent to this country clandestinely, through the agency of a citizen of Youngtown, Ohio, who had a relative in the works in Russia. It is generally understood that Russia has heretofore kept a close monopoly on this superior iron, and that she has thus been able to extort from us, as well as from other nations, a heavy revenue therefrom.

On the contrary, it is said by at least one party, that there is no secret whatever in the Russian process, and that travelers have free access to the works, and are allowed to witness every part of the operation; and that any peculiarity or superiority in the iron lies in the quality of the ore from which it made! William Atkinson, in his "Oriental and Western Siberia," says:

Verne Issetzkor Zavod, about three versts from Ekaterinburg, belongs to the Yakovliff family. These iron works have long been celebrated for the quality of sheet iron, which stands unrivalled. The sheet iron made in this Zavod, and some other works belonging to it, surpass all other productions of the kind, either in the Oural or elsewhere. It is rolled for various purposes—for covering the roofs of houses, for sheet iron stoves, and for a great variety of utensils. The metal is of such excellent quality that I have seen it rolled as thin as post paper, without crack or blemish, and with a jet black polish. An enormous quantity of the various sorts of this manufacture is sent to America. In the South Oural is Zavod of Kaslinsk; these iron works are famed throughout the Oural for the superior quality of castings they produce. I was astonished by the sharpness and beauty of the different articles manufactured, consisting of tables perforated by tracery and foliage, most delicately executed; chairs of a similar pattern, small boxes, baskets, and dishes for cards, in beautiful open work; animals, paper weights, etc., cast equal to anything produced in Berlin. The metal used possesses much fluidity.

**STEEL RAILS.**—On the London and North-Western Railway, at Chalk Farm station, is a rail, made of Bessémer steel, which has outlasted twenty-five iron rails successively placed next to it on the same line. The economy of the steel rail is so apparent that several prominent roads in this country have commenced substituting them instead of the ordinary iron rail.

**CAST IRON IMPROVES WITH AGE.**—It is well known that cast iron, by repeated fusion up to a certain number of times, is greatly increased in strength; and that guns cast hollow are stronger than those cast solid and bored out. But it is not so generally known that old castings are much stronger than new ones; yet such is the fact, as has been proven in various ways, but perhaps in none more fully than in experimenting with cannon. It has been found that eight-inch guns, proved thirty days after being cast, stand but about 72 charges; thirty-four days, 80 charges; one hundred days, 730 charges; six years, 2,582 charges. This phenomena of increased tenacity with increased age is accounted for on the supposition that the particles of iron, strained in the process of cooling, re-adjust themselves, in the lapse of time, to their proper position, and become perfectly free, or nearly so. These are important facts not generally known, even to many who claim to be engineers in the science of mechanics, and fully accounts for the terrible loss of life, on both sides, during the late war, from the bursting of cannon—nearly all the cannon employed being, from the necessity of the case, of but recent manufacture, and not having had time to become properly "seasoned," if such an expression may be allowable. This fact may also account for certain breakages in machinery which has been set to work very soon after coming from the foundry. If the facts are as stated, they are well worth the attention of mechanics; if not, they should be disproven.

**WETTING BRICK.**—It is important that every one engaged in laying brick, whether as master workmen or ordinary laborers, should be well informed with regard to the philosophy of "wetting" this universal material for building; hence we publish the following from an exchange:

Very few people, even builders, are aware of the advantage of wetting bricks before laying them, or if aware of it, they too often neglect to practice it. A wall twelve inches thick, built of good mortar and bricks well soaked, is stronger than one sixteen inches thick built dry. The reason of this is, that if the bricks are well saturated with water, they will not abstract from the mortar the moisture necessary to its crystallization; and, on the contrary, they will unite chemically, and become solid as a rock. On the other hand, if the bricks are put up dry, they immediately take up all the moisture from the mortar, leaving it to dry and harden, and the consequence is, that when a building of this description is taken down, or tumbles down of its own accord, the mortar from it is like so much sand.

**THE HYDRAULIC PROPELLER.**—Admiral Elliott, in a paper read before the Institution of Naval Architects, has come out very strongly in favor of the "Water Witch" principle as the future motive power for ships of war. He was as strongly sustained in the ensuing discussion by Sir Edward Belcher, and warmly encouraged by Mr. Scott Russell, while Mr. Reed, Chief Constructor of the Navy, and others, opposed. Mr. Russell predicted that, with time and perseverance, the plan would certainly succeed in the end, and supersede the screw for the purposes of warfare.

**POINTING THE RAILS.**—It has been found that trains of ordinary express speed, have jumped depressions of two feet in length on the rail. If an engine, going sixty miles an hour, could be run up an angle of 45° for its own length, and then allowed to jump off, it would jump 60 feet high, and 240 feet forward. The distance jumped would be as the square of the speed.

**SAFETY CAN FOR HYDRO-CARBON OILS.**—Two American inventors—Messrs. Perkins and House—have patented a can that will protect benzine or any other hydro-carbon fluid from danger of explosion. The principle on which it operates is similar to that embodied by Sir Humphrey Davy in his safety-lamp.

**BRONZING TIN CASTINGS.**—When clean, wash them with a mixture of one part each sulphate of iron and sulphate of copper, in twenty parts of water; dry, and again wash with distilled vinegar, eleven parts, verdigris, four parts. When dry, polish with colcochar.

## Scientific Miscellany.

**THE METEOROGRAPH.**—Among the scientific instruments on exhibition at the Paris Exposition, none attracts more attention than the "meteorograph," an invention of the celebrated Italian astronomer, Father Secchi. This wonderful instrument records, automatically, the time of day, the changes in the temperature, pressure, moisture and motion of the atmosphere, etc. The distinguished inventor is in Paris, and spends the most of his time at the Exhibition, carefully noticing and studying everything new and valuable. The instrument of which he is the inventor moves by clock-work, and marks down upon a long strip of paper, which is unrolled at one end and rolled up at the other, the time of day, the changes in temperature, the direction and intensity of the wind, the height of the barometer, the hygrometric state of the atmosphere, and the quantity of rain which may have fallen within a given time. All this is effected by a pencil for each separate work, kept constantly in motion, and moved by nicely-adjusted machinery, which performs its task with unerring certainty and fidelity. The diagrama made by this instrument, as well as the instrument itself, are objects of great interest among the scientific as well as curious portion of the visitors.

**SINGULAR SCIENTIFIC FACT.**—If the large bell of Notre Dame, in Paris, which is placed in a chamber at the base of one of the towers, be struck with the closed hand, a large volume of sound will be produced, and will be audible at a considerable distance all round; but it is said to have been discovered that it will be perfectly inaudible if the person places himself within the center of the bell, the sound diminishing as he proceeds from the circumference.

**PRECIPITATING SILVER WITH CADMIUM.**—According to M. Classen, silver is wholly precipitated by cadmium; when dealing with a nitric solution of silver, evaporate to dryness in the presence of sulphuric acid, dissolve the sulphate of silver in boiling water, plunge it into a plate of cadmium, and the reduction of the silver takes place at once. The silver is deposited in a compact mass, easily washed with water; as it may contain a little cadmium, boil it in the acid liquid until no hydrogen escapes; wash it until the water contains no sulphuric acid; then dry and calcine. The silver, at first a black grey, takes the metallic luster. It may then be weighed; the results are very exact.

**A HIGH ILLUMINATING GAS.**—A raw compound of creosote and soda may be employed for the manufacture of gas of a high illuminating power, by burning carbonate of soda in a close furnace. In the first step of the proceeding the water is driven from the material; the creosote and soda compound is then decomposed, a porous coke with which the soda is mixed being left. One result of the decomposition is the formation of a quantity of carbonic acid, the greater part of which unites with the caustic soda employed to produce the carbonate. The carbonate of soda is easily extracted from the coke, and may be used again and again.

**A SIMPLE ICE MACHINE.**—A machine has been contrived which freezes water by its own evaporation. It is simply an air-pump fitted to a bottle. The bottle is half filled with water, and the pump is set to work. Air is first pumped out, and then the water rapidly evaporates. To complete the vacuum and increase the evaporation, the air and aqueous vapor pumped out is made to traverse a hollow cylinder containing sulphuric acid, which, of course, instantly absorbs the moisture. The evaporation is so rapid that the remaining water is immediately frozen. Four minutes' pumping produce two pints of ice.

**PURE ACETIC ACID.**—Fictor, of Berlin, uses baryta, in preference to soda or lime, in the manufacture of pure acetic acid from crude wood vinegar. The acetate of baryta withstands the roasting necessary to get rid of the empyreumatic matters better than the acetates of lime or soda, in consequence of which there is less loss of acetic acid.

**MINIATURE VOLCANO.**—Among the numerous experiments which may be made with Ruhmkroff's machine, there is a remarkable one, which may be described as follows: A quantity of flour of sulphur is mixed with a small proportion of iron filings, or, better still, with iron reduced by hydrogen, in which case it is in quite an impalpable state; zinc and copper filings may also be added in small quantities. The mixture, which must be as complete as possible, is then thrown on a pane of glass, or on a dry brick, so as to form a heap two or three centimetres high, and much longer than it is broad. If the ends of the wires of Ruhmkroff's machine be now inserted into the heap, so as to be two or three centimetres distance from each other, and the current made to pass through, a violent explosion of the mass takes place, a sort of crater is formed, whence magnificent showers of fire will be seen to issue, much resembling the bouquet of fireworks, and like it displaying different colors. It is in reality a miniature volcano, with subterranean noises and ejection of boiling lava.

**INGENIOUS AND BEAUTIFUL EXPERIMENT.** Place on a sheet of white paper, in the sunshine, a circular piece of blue silk about four inches in diameter; cover the center of this with a piece of yellow silk three inches in diameter; then one of pink, two inches across; a green one, one inch across, and one of indigo, half an inch in diameter, and in the center of this make a black dot with a pen. Then look steadily for a minute at the central spot, closing your hands about an inch distant before them, and you will see the most beautiful circle of colors that the imagination can conceive, which are not the colors of the silk alone, but will be perpetually changing in the most pleasing manner.

**COLD AFFECTING THE REGULAR GROWTH OF TREES.**—At the late Botanical Congress, Prof. Caspary, of Königsberg, gave the results of some elaborate observations on the effect of low temperatures in altering the direction of the branches of trees. He stated that different species were acted on in divers ways; some species move, during a frost, directly upward, while others move downward, but in nearly all there was a lateral movement toward the left.

**TIN FOIL.**—Nearly all tin foil now used is adulterated by lead. Dr. J. H. Baldock found by chemical analysis that common tin foil contained 86.92 per cent. of lead; embossed foil, 76.57 per cent.; tea foil, 88.66 per cent., and the so-called pure tin foil, 32.62 per cent. of lead. The adulterated article is made by placing an ingot of lead between two ingots of tin, and rolling them into sheets which have a coating of tin on both sides.

The alloys of steel with platinum, when both are in a state of fusion, are very perfect in every proportion that has been tried. Equal parts by weight form a beautiful alloy, which takes a fine polish, and does not tarnish; the other is the finest imaginable for a mirror. The specific gravity of this beautiful compound is 9.862.

**NEW SILICUM COMPOUND.**—Friedel and Ladenburg have prepared a body containing one atom of hydrogen, one of silicon, and three atoms of chlorine. It boils between 34° and 37° 5 C., the vapor of which, mixed with air, explodes on contact with an ignited body. The gas is not spontaneously inflammable at ordinary temperature.

**IMPROVEMENT OF STARCH.**—A small quantity of epsom salts (sulphate of magnesia) added to starch increases considerably its stiffening powers, and renders the article on which it is used, to a certain degree, fire-proof.

**METEORIC.**—M. Leverrier, the celebrated French astronomer, predicts that we shall have a shower of meteors in August, altogether surpassing in brilliancy and extent the display a year ago.

The curvature of the earth amounts to seven inches per mile. A man six feet high cannot be seen from a distance of ten miles.

The presence of copper in the white and yolk of eggs, has been determined by M. Blasius.

Solid carbonic acid sinks the thermometer to 162 degrees (Fah.) below zero in two minutes.

Water, heated in a strong closed vessel, has melted lead in 612 degrees.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to Inventors on the Pacific Coast, and other Patent Issues, which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

RECENT INVENTIONS.

DISNEY'S AUTOMATIC CAR-COUPLER.—This is a new and ingenious device of Mr. M. Disney, of this city, whereby cars may be made self-coupling at all times, while they may be uncoupled at any time by the mere moving of a lever, which immediately adjusts itself as soon as the cars uncouple. Another most important advantage derivable from this invention is the fact that the instant the advance car moves, or is thrown from the track, it instantly uncouples. It is impossible for this coupling to drag a car off from the track; neither is there any possibility of its becoming disengaged while the cars are in direct motion, except by design or breakage of the link. The device is simple and cheap—not more costly than the ordinary couplings—while its economy, convenience and safety advantages are not excelled by any device in use for such purposes. By the time this is in print it will have had a practical trial on the San José Railroad. The invention can scarcely fail to come speedily into general use. We shall probably give an illustrated description of this invention within a week or two. A patent has been applied for.

MCDUGAL'S IMPROVED GOLD AND AMALGAM SAVER.—The particular object of this invention is to save the "float gold," which usually passes off on the surface of the water. It has heretofore been found almost impracticable to bring this light gold in contact with the copper surfaces usually employed for saving it. This, however, is pretty effectually done by Mr. McDougal's invention. The water, in passing through his boxes, is thrown into a series of eddies, which may be continued for any distance required, and by which the surface and any matter floating upon it is repeatedly thrown against copper surfaces, in precisely the manner best calculated to secure any amalgam which may thus be passing off. We are not at liberty to more fully describe the device at this time; but shall do so as soon as the patent, which has been applied for, shall have been granted. The invention appears to possess unquestionable merit as a gold saver.

PRESSURE APPARATUS FOR SODA WATER. This device is the invention of Mr. Benjamin Sweetland, of Sacramento. The object of the invention is to effect a proper mixture of soda water with the acids by hydraulic force, instead of by a force-pump, as is usually done. To do this, the fountain is placed at a proper elevation above the counter, as in a room overhead; a pipe connection is so made with the fountain as to bring the water up through the table in the ordinary manner by its own head, instead of by a force-pump. It is much simpler, and more convenient, than a pump, and equally as effective. Patent applied for.

A TINNER'S PRESS.—In the manufacture of tinware, it has heretofore been the custom to have the covers of pails, pots, cans, etc., pressed into shape with dies made to drop with a heavy weight, which are not only expensive, but cumbersome. A machine has recently been invented which is destined to revolutionize this kind of work. It is called a "tinner's press." The tin is cut to the requisite size and placed in an iron frame; a die is then pressed against the tin, and the frame made to revolve for a few seconds, when the cover is taken out ready for use. The machine is simple and easily worked.

A MOTOR FOR THE SEWING MACHINE.—M. Faivre, of Nantes, exhibits at the Paris Exposition a water motor for the sewing machine, which is pronounced eminently practical, and so cheap that every seamstress can afford to purchase one and attach it to her sewing machine. The injurious influence of the use of the treadle upon the health of females is becoming an alarming evil, and that attachment will soon have to be dispensed with, even, if it be necessary, at the sacrifice of this useful machine itself.

NITRO-GLYCERINE is cutting the Pacific Railroad through the summit of the Sierra Nevada at the rate of fifty feet per week, and by midsummer fifty miles of road will be added to the ninety-four already in operation at the California end.

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board. SAN FRANCISCO, SATURDAY MORNING, July 20, 1887.

City Stocks.

Under the unusual excitement which pervaded the mining share market since Saturday last, making serious inroads on the prices which had prevailed for weeks previous, city stocks have been quite inactive, and the offerings few. North Beach and Mission R. R. sold at \$52 @50 1/2 share; San Francisco Gas at \$63 60, buyer 30, and \$63 25; Cal. Steam Nav. Co. at 69 1/2 @ 70 1/2 ct.; Spring Valley Water at \$67; and National Insurance Co. \$69 60.

The receipts of the local insurance companies during the first six months of 1887, according to the returns made to the Internal Revenue Department, have been as follows:

Table with 4 columns: Company, June, Previously this year, Total. Includes Pacific, Union, National, Fireman's Fund, Builders', California, Merchants' Mutual Marine, Occidental, Home Mutual, San Francisco.

These returns were made upon a Legal Tender basis, the rate being fixed every month by the Collector of the District, as follows: In January, 74 1/2%; February, 73 1/2%; March, 76%; April, 76%; May, 74%; and June, 73%.

The above named companies disbursed the following dividends for the six months ending June 30th:

Table with 4 columns: Company, Per cent, Capital, Amount. Includes Pacific, Union, National, Fireman's Fund, California, Occidental.

The Home Mutual Insurance Company was organized under the special law passed in 1851, which, in effect, requires all the surplus earnings to be carried forward until such time as the accumulations amount to as large a sum as the original capital paid in. Thus, this company has a surplus of \$100,000 over and above its capital of \$226,000, and will, therefore, require an additional sum of \$126,000 before any distribution in the shape of dividends can be made to the stockholders.

The Merchants' Mutual Marine Insurance Company was organized April 24, 1863, under the Act of 1851, for the incorporation of mutual insurance companies. Fifty per cent. of its capital has been called in, which, with the accumulations of the company, enabled them to declare their stock fully paid up on April 1, 1887, amounting to \$500,000.

From the fourth annual statement of the Pacific Insurance Company, for the fiscal year ending June 30th, 1887, we obtain the following: Capital stock, \$1,000,000, excess of capital available to pay losses and dividends, \$238,054 91, showing the assets to be \$1,238,054 91. The income has been \$677,106 04, and the disbursements amounted to \$578,789 17, including \$193,000 in dividends and \$249,945 69 in fire and marine losses.

Net amount fire risks written during the year... \$26,011,093. Net amount marine risks written during the year... \$5,579,600. Amount fire risks in force June 30, 1887... 20,838,521. Amount marine risks in force June 30, 1887... 2,387,918.

Most of the above dividends were made payable on the 15th inst. The California Insurance Company will carry over a surplus of \$100,000 after paying its usual semi-annual dividend.

The receipts of the city railroads for the month of June and previously this year have been as follows:

Table with 4 columns: Railroad, June, Previously this year, Total. Includes Omnibus, North Beach & Mission, Central, Front St., Mission & Ocean, Market Street.

The usual dividends paid by the majority of the above companies during the present year have been 1/2 per cent. per month on their capital stock. The increase of travel on all the lines indicates a healthy prospect for the future. There is little room to doubt that, with the increase of population in the city, the receipts of all its railroads will be augmented, and the stocks improve in value.

Mining Share Market.

During the period under review the mining stock market has undergone a very marked change, a panic having occurred which affected nearly every stock on the list and carried some of them down to more than half the price obtained within less than two weeks previously. The decline has been so unprecedented that a large number of speculators have been cornered and will doubtless, in many cases, meet with severe losses, while others are improving the opportunity to obtain stocks at a rate which it is positive will not prevail for any length of time. Even capitalists in the East have been availing themselves, to some extent, of this serious decline, and within the past few days a considerable amount of capital has been transferred by telegraph for investment in this class of securities. Some persist in holding to the opinion that the mines are giving out, that the exhaustive process has been pursued to its utmost limit. We cannot coincide with those views, but, on the contrary, believe that the favorable developments heretofore reported will increase rather than fall off. The productive condition of the mines on the Comstock Lode was not disputed two weeks since, and we have no reason to think that they have shown any signs of "petering out" within that brief period. At the close a reaction had taken place in most shares, and the future looked brighter.

SAVAGE—Declined from \$4,500 to \$4,000, rallied to \$4,400, and at the close sold at \$4,400. The ore extracted during the week ending July 13th amounted to 2,039 tons, showing an approximate value of \$77,047, or an average of \$38 98 per ton. The previous week compares as follows with these returns—extracted, 1629 tons; approximate value \$66,440, equal to \$40.78 per ton. The various portions of this mine yielded the following amount of ore

during the week under review.—Old works 36 tons; North mine, on 7th level, 1,143; middle mine, same level, 654; south mine, same level, 263; 3d station drift north, 64, and the same station drift south, 45 tons. The following statement from the annual report of this company, for the fiscal year ending July 10th, has been kindly furnished us by the Secretary:

Table with 2 columns: Receipts, Disbursements. Receipts include Cash on hand July 10, 1886, Bullion, Premium on Drs., Ore sold, Other receipts. Disbursements include Labor account, Reduction of ores and expenses at Company's mills, Reduction of ores at outside mills, Mining supplies, Wood and coal, Legal expense, Other expenses.

Number of tons mined during the year, 72,295; reduced, 69,376 1/2; sold, 63; on hand, 2,855 1/2. Cost of production, \$7 91; reduction, \$14 04—total cost per ton, \$21 95. Average yield per ton, \$41 94. HALE & NORRIS—In quotable, at the close, at \$3,200 asked. From the 1st to 14th instant, 1,412 1/2 tons of ore were reduced, the 65 1/2 cent assay value of which shows a yield of \$58,000, equal to \$41 per ton. The shaft, on the 14th instant, was 534 feet in depth.

CROWN POINT—Rapidly receded from \$1,430 to \$890, rallied to \$1,300 and closed yesterday at \$1,210. From the Superintendent's statement for the week ending July 12th, we learn that 742 1/2 tons of ore were shipped to custom mills, and in the same time 829 tons were extracted from the mine, the 65 cent assay value of which showing a yield of \$24,770 in bullion, equal to \$29.88 per ton. The ore obtained from east drift averaged about \$75 per ton, but that taken from the west workings reduced it to the above general average. The west drift on the 500-foot level has been carried forward 172 feet, and the East lode on the same level, has been opened, north and south, 107 feet. The cross-cut from the lode is in 12 feet, and the east drift from the 500-foot station has attained a distance of 68 feet. It is reported that there is some improvement in the north end of the east lode on the 500-foot level, but that the south end remains about the same. The 65 1/2 cent, average assays of ore mined within a few days past show a yield of \$39 and \$42 to the ton.

YELLOW JACKET—Showed a further decrease in price since our last reference, having declined from \$940 to \$700, recovered to \$900 and closed at \$875. The ore at the north has been decreasing for some time past, and the general appearance of the mine is not so flattering, yet there is no real cause for the sudden decline in the stock.

GOULD & CURRY—Has been quite active, opening at \$700 @740, receding to \$630, improving to \$776, and closing at \$725. In the south drift, 5th station, a body of quartz has been cut this week, being the first found in the vicinity—true, there was no ore found, but this quartz may be regarded as the advance guard of a probable ledge. The mill will be running in August, and a sufficient quantity of ore has accumulated, and will be mined, to insure it steady work for at least nine months, and in no event need an assessment be expected during that space of time. This company is making alterations in its mill by which it is thought a great saving of expense will be effected.

KENTUCK—Opened at \$400, fell to \$300, advanced to \$410, and closed at \$415. The receipts of bullion for the current month to the 15th amounted to \$41,632 83; in June, from 1st to 17th, the returns sum up \$46,900. The receipts and expenses, it is thought, will not vary much from last month.

CHOLLAS POTOMI—Declined from \$430, seller 30 to \$320, gradually advanced to \$425, and closed at \$450. No important change to note in the mine since our last issue. Amount of ore sent to custom mills from July 5th to 11th, 2,186 1/2 tons.

OVERMAN—Since date of last review, fell from \$220 to \$110, and at the close sold at \$170. We learn of nothing discouraging from this claim. They are now extracting about 50 tons of ore per day, and since our last issue nearly \$6,000 worth of bullion has been received; at the office in this city.

IMPERIAL—Rallied from \$213 to \$182 50, and sold on 17th at \$200. This company has received about \$19,000 in bullion from the first to the 16th inst., being within a fraction the same amount as returned in a like period in the previous month.

OPHI—Opened at \$300, dropped to \$200, improved to \$267, and closed at \$230. There is some talk about sinking a new shaft on G Street. We have nothing of importance regarding recent developments in the mine.

BELCHER—Declined from \$360 to \$210, advanced to \$350, then sold at \$285 @310, and closed yesterday at \$315. EMPIRE ruled uniformly at \$180. Confidence sold at \$55 @60. BULLION opened at \$36, dropped to \$20, improved to \$34, and at the close sold at \$32 50.

SEORAGATED BELCHER—Sold within a range of \$12 @8, and closed at \$11. The foreman of the mine, in a letter dated the 12th instant, states that he is taking out ore that will pay \$40 to the ton. SIERRA NEVADA opened at \$16, receded to \$13 60, advanced to \$17, and closed yesterday at \$16. The opinion prevails that the pumps will be in working condition by the 15th of next month.

JUSTICE AND INDEPENDENT—Have been less active, selling at \$16 @15. An assessment of \$5 per share was levied on this stock on the 12th inst. WHITE ANN MURPHY, a claim not in market at present, levied an assessment of \$6 75 per share, or \$27 per foot, on the 3d instant.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,431,913.

SILVER ORE FROM BRITISH COLUMBIA.—

The Cherry Creek Silver Mining Company, Shuswap District, British Columbia, are taking out very rich ore, containing a large amount of black sulphurets, portions of which assay as high as \$2,000 to the ton. The company intend sending two tons of their ore to this city for reduction. Silver ore from British Columbia will be a new thing. We have a sample of the ore in our cabinet; also another sample of silver ore from the Kamloop Lake District. Should these developments prove extensive, as they promise to do, mining for silver may yet become an important business in British Columbia.

NEW INCORPORATIONS.—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

U. S. GRANT M. Co.—Excelsior District, Nevada county, Cal. July 13th. Capital stock, \$320,000; 3,200 shares, \$100 each. Trustees: Alpheus Bull, John G. Bray, L. A. Booth, T. L. Barker and J. E. Squires.

BAY VIEW WATER Co.—San Francisco. July 13th. Capital stock, \$100,000; 10,000 shares, \$100 each. Trustees: A. W. Von Schmidt, Thomas Hardy and W. H. Patterson.

CONSOLIDATED GOLD HILL M. Co.—Gold Hill, Nevada. July 12th. Capital stock, \$300,000; 600 shares, \$500 each. Trustees: A. K. Grim, A. Hirschman, Thomas Sunderland, John Sime and Lewis Gerstle.

SAN FRANCISCO C. M. Co.—San Luis Obispo county, Cal. July 13th. Capital stock, \$240,000; 2,400 shares, \$100 each. Trustees: John Knox, S. H. Dwinelle, Geo. F. Sharp, Geo. Treat and F. A. Benjamin.

THE LUMBER STEVEDORES ASSOCIATION.—San Francisco. July 12th. Trustees: W. Ekenberg, Isaac Cassin, Valentine McIntosh, Michael Ford, John Brennan and Peter Quinn.

CENTRAL PARK HOMESTEAD ASSOCIATION. San Francisco. July 18th. Capital stock, \$37,500; 150 shares, \$250 each. Directors: Edward Bosqui, John S. Day, William H. Souther, Howard Chapman, Timothy Sargent, Jos. P. Corcoran and Jos. M. Souther.

Rates of Postage on Printed Matter to Europe and Asia.

The Post Office Department has made arrangements by which a number of European and Asiatic countries, hitherto beyond the reach of our mail communication except by letter, are brought within the range of delivery of all, or nearly all, United States mail matter. It is a singular fact, unknown probably to most persons who have not occasion to learn it by unpleasant experience, that there was a considerable region in the civilized world where an American traveler might not receive a newspaper directly from home.

Under the arrangement now completed, postpaid postage (sometimes at high rates), is made necessary in all cases. The following official statement gives a full list of the countries—with some of which there has been regular communication—that are now included in this delivery by way of Hamburg and Bremen:

Rates of postage on newspapers and other printed matter (periodicals, etc.) sent from the United States to countries in Europe and Asia, by Bremen or Hamburg mail—prepayment compulsory: NEWSPAPERS—MARKED AS FOLLOWS:

- Bremen, by Bremen mail—2 cents each. Hamburg, by Hamburg mail—2 cents each. Prussia, Austria and German States, by Bremen and Hamburg mail—3 cents each. Lunenburg, by Bremen mail—3 cents each. Lunenburg, by Hamburg mail—3 cents each and 1 cent per 1/2 ounce. Schleswig-Holstein and Denmark, by Bremen or Hamburg mail—3 cents each and 1 cent per 1/2 ounce. Sweden, by Bremen or Hamburg—3 cents each, and 1 1/2 cent per 1/2 ounce. Norway, by Brsmee or Hamburg—3 cents each, and 3/4 cents per 1/2 ounce. Holland, by Bremen or Hamburg—3 cents each, and 1 cent per 1/2 ounce. Russia, by Bremen or Hamburg—3 cents each, and 1 cent per 1/2 ounce. Switzerland, by Bremen or Hamburg—4 cents each. Italy, by Bremen or Hamburg—5 cents each. Turkey, by Bremen or Hamburg—3 cents each, and 6 1/2 cents per 1/2 ounce. Greece, by Bremen or Hamburg—3 cents each, and 6 1/2 cents per 1/2 ounce. Gibraltar, Spain and Portugal, by Bremen or Hamburg—3 cents each, and 1/2 cent per 1/2 ounce. Austria, India and China, by Bremen or Hamburg mail via Marseilles—3 cents each, and 9 cents per 1/2 ounce. Austria, India and China, by Bremen and Hamburg mails, via Trieste—3 cents each, and 2 cents per 1/2 ounce.

- BREMEN AND HAMBURG, ETC. Bremen, by Bremen mail—1 cent per ounce. Hamburg, by Hamburg mail—1 cent per ounce. Prussia, Austria and German States, by Bremen or Hamburg—1 1/2 cent per ounce. Lunenburg, by Bremen mail—1 1/2 cent per ounce. Lunenburg, by Hamburg mail—1 1/2 cent per ounce, and 1 1/2 cent per 1/2 ounce. Schleswig-Holstein and Denmark, by Bremen or Hamburg—1 1/2 cent per ounce and 1 1/2 cent per 1/2 ounce. Sweden, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 cents per 1/2 ounce. Norway, by Bremen or Hamburg—1 1/2 cent per ounce, and 4 cents per 1/2 ounce. Holland, by Bremen or Hamburg—1 1/2 cent per ounce, and 1 1/2 cent per 1/2 ounce. Russia, by Bremen or Hamburg—1 1/2 cent per ounce, and 1 1/2 cent per 1/2 ounce. Switzerland, by Bremen or Hamburg—1 1/2 cent per ounce, and 1 cent per 1/2 ounce. Italy, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 cents per 1/2 ounce. Turkey, by Bremen or Hamburg—1 1/2 cent per ounce, and 6 1/2 cents per 1/2 ounce. Greece, by Bremen or Hamburg—1 1/2 cent per ounce, and 1 1/2 cent per 1/2 ounce. Gibraltar, Spain and Portugal, by Bremen or Hamburg—1 1/2 cent per ounce, and 2 1/2 cents per 1/2 ounce. Austria, India and China, by Bremen or Hamburg mail, by way of Marseilles—1 1/2 cent per ounce, and 9 cents per 1/2 ounce. Austria, India and China, by Bremen or Hamburg mail, by way of Trieste—1 1/2 cent per ounce, and 2 cents per 1/2 ounce. These charges are in each case in full to destination, combining rates between the United States and Bremen or Hamburg, and the rate beyond Bremen and Hamburg to points of delivery.

FACTS FOR THE PEOPLE.—Every family should have a bottle of Healy's Curative Oil in the house, prepared to alleviate pain. It is the best remedy in the world for Rheumatism and Gout, Neuralgia or Headache, Toothache, Cramps in the Limbs, Dizziness, Sprains, Bruises, Burns and Cuts; Scalds, bite of poisonous insects, Frozen Feet, etc. Be your own physician, and get the best, for the best is the cheapest. The Curative is composed of eleven ingredients, active and penetrating in their nature, and of purely vegetable extraction; is free from all minerals and acids deleterious to the human system; is warranted to give immediate relief from pain, and the cure is permanent. Sold by all druggists. Principal Depot, No. 5 Montgomery street. 22v14-1amtr

SALES OF THE WEEK

BY THE S. F. STOCK & EXCHANGE BOARD
Monday, July 15.
AFTERNOON SESSION.
123 sbs Ophir at 250 per foot.

Tuesday, July 16.
144 sbs Ophir at 200 per foot.
253 sbs Ophir at 212 1/2 per foot.
5 sbs Confidence at 55 per share.

Wednesday July 17.
70 sbs N. B. & Mission R. R. at 62 pr sb.
4 sbs Gould & Curry at 660 per foot.

Thursday July 18.
463 sbs Ophir at 215 to 225 per foot.
24 sbs Ophir at 225 per foot, s 30.
24 sbs Ophir at 225 per foot, b 30.

4 sbs Crown Point at 1200 per ft s 10.
24 sbs Crown Point at 1250 to 1350 per ft b 30.
32 sbs Crown Point at 1300 to 1300 per ft b 30.

Friday, July 19.

ELECTION OF OFFICERS.—SAVAGE M. Co.

July 18th. Trustees: Alpheus Bull, Thos. Bell, M. Mayblum, A. H. Rose and A. Hayward.

MECHANICS' INSTITUTE.

Resources of California. THE MECHANICS' INSTITUTE of San Francisco, hereby offer a PREMIUM OF ONE THOUSAND (\$1,000) DOLLARS for the best Essay on the "RESOURCES OF CALIFORNIA, AND BEST METHOD OF DEVELOPING THE SAME."

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, July 13th: Work in and about the Tarshish mine is being prosecuted in a vigorous and permanent manner. A new furnace for furnishing the mine with pure air has been completed. A carpenter shop is in course of erection, where the timbers for the protection of the mine will be framed. The north drift is now in a distance of 35 ft., all in pay ore; the south drift about 20 ft., part pay ore and part poor in quality. Cross cuts will be made every 50 ft. to determine the quality and quantity of ore to be depended on for purposes of erecting reduction works.

In Silver Mountain Dist, the I. X. L., Mountain and Pennsylvania companies are working away with renewed vigor, the first in quartz both in the upper and lower tunnel.

A. E. Kennedy, Supt. of the Mexican M. Co., in his report to the Board of Trustees of the Morning Star G. & S. M. Co., Morning Star lode, says: "The indications for a large body of ore in this mine are equal to any I have seen—the Comstock not excepted. When a greater depth is obtained, you will find the ore almost entirely free from base metals, and I have no doubt can be worked by common mill process at the mine."

## Calaveras County.

*San Andreas Register*, July 13th: Thorn & Co's mine is giving out the gold merrily. In sinking their shaft to its present depth, 50 ft., the Co. have picked out over \$2,000 in nuggets of different sizes, from a pin's head to a hen's egg. All the dirt and rock from the shaft is to be handled and worked yet, and it is confidently expected that argosies of wealth will be found therein. Since the above was written, over \$300 was picked up in one day, by the workmen, in boulders of rich shining ore.

## Inyo County.

*Virginia Trespass*, July 10th: Mr. Jacques, just from Cerro Gordo, reports the weather very hot and water scarce. Some new ledges, reported to be immensely rich, have been located further south and east. A number of prospectors are on their way hither.

## Kern County.

*Havilah Courier*, July 6th: Recently, J. B. Malin and Geo. Millican, of Telachapi, the principal owners of the Ophir, Laurel and Millican ledges, believing in the richness of Kern county, resolved to give the district another trial, and went to work on the Millican ledge. The ledge is 12 ft. wide at the surface. A shaft has been sunk 180 ft., and from the bottom a drift started to cut the ledge. They have already struck two stratas, from 2 to 4 ft. in width, the last containing some very rich ore. The rock from the surface, worked on two trials in a mill, yielded \$65 and \$70 per ton, and assays as high as \$1,600 have been obtained. The character of the ore strongly resembles that of Blind Springs and Montgomery districts in Mono county.

## Los Angeles County.

*Wilmington Journal*, July 13th: The editor has seen some very rich argentiferous galena specimens from Catalina Island, taken from the Small Hill Mine 150 ft. below the surface and 500 ft. above the level of the sea. Arrangements are being made to work these mines more extensively than heretofore. It is in contemplation to erect a smelting furnace on the Island.

## Mariposa County.

*Gazette*, July 13th: Very flattering prospects are being struck on Big creek, in the vicinity of the Big Trees and Clark's ranch. Three bit prospects are reported from various points on the creek.

## Nevada County.

*Transcript*, July 13th: The Scandinavian ledge, which was located a month or two ago, has been opened to a considerable depth, and a ledge 20 in. in thickness has been found. The editor has seen a prospect from two pans of the rock, which is richer than anything seen for a long time, free gold being found in large quantities.

At Eureka, business is as lively as a '49 mining camp. Several excellent quartz ledges are being worked, and a large amount of prospecting is being done. Besides these interests, much is being done to open good gravel claims.

July 14th: The quartz ledge recently discovered and located by L. W. Hadcock, between Moore's and Orleans Flats, is being rapidly developed. Enough is ascertained to know that it surpasses the most sanguine expectations. It contains a large amount of sulphurets, besides free gold often seen

with the naked eye. The tunnel has been driven 90 ft. into the bill, the ledge being taken out all the way, which shows a uniform thickness of 18 in., mostly decomposed quartz. At a depth of 37 ft., attained through an incline from the center of the tunnel, the ledge is found to be increased in thickness, and equal in quality, if not superior, to that above. It is the opinion of some that the rock, properly and systematically worked, would readily yield \$100-per ton. It is the intention of the owner to ship a quantity of the rock either to Nevada or Grass Valley, to have a test made.

Reasoner and others have located a ledge at Eureka, a mill test of which, made by Kidd & Co., showed the rock to be very rich. The ledge is 6 ft. wide, 2 ft. of which is sulphuret rock, and the remainder contains free gold. Separate tests were made, and the sulphuret rock was found to be worth \$133.20 per ton, and the rock containing free gold averaging \$23.31.

*Gazette*, July 12th: The Banner Co. have made arrangements to add 10 additional stamps to their mill. The mortars, stamps and other iron work will be manufactured at the Nevada Foundry. For some time the mine has been supplying rock for 20 stamps; but these being found insufficient to reduce all the ore afforded by the mine, the company have determined to enlarge the crushing facilities of their own mill.

**EXCELSIOR.**—*Enterprise*, July 11th: The mill of the Mohawk and Montreal Co. which started up on the morning of the 4th, have on hand a large lot of excellent ore, and the process used by them is that most approved in the mills of Grass Valley and Nevada City. The Excelsior mill has started up eight stamps, and the Meadow Lake reduction works will start in a few days. The Golden Eagle has cleaned up a run of 10 tons, the ore paying \$28 per ton. The Green Emigrant Co. has taken out a large lot of exceedingly rich ore, which will shortly be crushed at the reduction works, and the Enterprise Co. are about to furnish a large lot of rock to the same works; they have now on their dump nearly 3,000 tons of ore.

*Meadow Lake Sun*, July 13th: The Enterprise Co. have advertised for proposals, for sinking 50 additional feet on their shaft, and running 24 ft. from the bottom of the shaft, and timbering the whole.

The California mill is being cleaned up after running through 50 tons of Green Emigrant rock. The mill will start in a few days on rock from the Knickerbocker ledge.

The Excelsior and Mohawk mills are reported as working.

The editor has had placed upon his table the richest piece of ore yet seen in the district. It was from the Green Emigrant, and consisted of pure white quartz, completely speckled with particles of free gold. Twelve lbs. of amalgam, the product of 50 tons of Green Emigrant ore, was brought to town last night.

## San Bernardino County.

*Guardian*, July 13th: The machinery for Hueston's mill is now on the ground, on the top of the mountain. The boiler and other heavy portions were transported over the precipitous mountains all right.

The placer mines at Holcomb are turning out very well. There is not much doing in quartz mining. The Green lead is in operation, crushing by arrastras, the rock which is piled upon the claim.

## Sierra County.

*Downville Messenger*, July 13th: In the claims of Mr. Sol. Woods, at Monte Cristo, a few days since, there was found lying on the sluice boxes a piece of lava containing about 6% in gold. The piece had evidently got into the diggings from the surface, and had no appearance of having been washed.

## Tulare County.

*Visalia Delta*, July 10th: The Silver Sprout and Kearsarge Cos. are actively engaged in working their mines, with every prospect of rich returns. The Alabama Dist. is alive with miners, and along the base of the hills east of the river, some 300 Spaniards are at work with furnaces, arrastras, etc., getting out the precious metal.

## Tahoe County.

*Columbia Citizen*, July 13th: Mining interests in this section have thus far this year yielded a larger per cent. than they did last year. But it is not to be concealed that the placer mining interest has very much decreased, on account of the large number of claims that have been worked out and abandoned; but the quartz diggings are still being developed and wrought with success.

## ARIZONA.

*Miner*, June 29th: Work has been suspended on the Williams Fork—cause, the unusually low price of copper. At Big Bug, Anderson & Beutel recently took out \$27 in two days. Lynx Creek continues to pay

fairly. Crump and others have been doing well on the upper Hassayampa.

*Salina Herald*, June 12th: The American Gila River Mining Co., are organizing and fitting out, at Salina, their second expedition to the gold and silver mines near Pinos Altos, New Mexico. The party have commenced to rendezvous there, and will start across the plains about the first of July.

July 13th: New diggings have been struck on Pleasant Creek. The gold is found in an old channel, and have paid well, yielding \$10 and \$12 to the man per day. The gold is coarse and heavy, and worth \$16.50 per ounce.

Marvelous tales are told about a rich quartz lode which has recently been struck on Foot's Creek.

## COLORADO.

*Times*, June 25th: On the 14th inst., one-half of the Mexican lode sold for \$20,000, and on the 16th, the east end of the Nuckoll's sold for the same amount.

Prof. Hill has purchased a mill site below Black Hawk, and will erect a furnace and works for separating ore. The old Idaho mill is being enlarged. The Wycoff process will soon be in operation there.

A hutton of pure silver has been turned out by the Georgetown Silver Smelting Works, from Pewabic ore, weighing 60 lbs. avoirdupois, worth in greenbacks, \$1,332.92. The previous week's run was 50 lbs., that of the week before, 73½ lbs., being the sum of \$41,000 from the first three weeks run of this furnace.

J. A. Conlee, on the Gunnell lode, on Clear Creek, last week realized 117 ozs. of retort.

Mr. Beach is working ore from the Briggs lode, in the Briggs mill, and is doing splendidly. During the past week he took out 85 ozs.

The Black Quartz mine in Quartz Valley, is being worked by the Belden & Terrell Co. The shaft is in about 70 ft. There is a pile of pyrites outside quite various in its nature, blue pyrites of iron predominating.

Work has been commenced on the Burroughs mine. Jas. E. Lyon & Co. shipped a gold bar yesterday, weighing 183 ozs. From 700 lbs. of Adeline ore, and 500 lbs. blanket tailings worked at the Holman mill, there were 31 pwts. of pure gold per ton, valued at \$55.

A new mill has been erected on the Pewabic lode.

*Georgetown Miner*, June 24th: A company has been formed in Louisville, Ky., upon property in Iowa Dist., under the title of the Crescent Mining Co. Prof. Martine's reduction works are rapidly approaching completion.

The editor saw a piece of bullion weighing 6¼ ozs., the product of five lbs. of Nuckoll's ore.

The total amount of bullion taken out in Clear Creek county this week, is \$2,564.20.

*Denver News*, June 26th: Col. Fry and Mr. Cobb in a gulch on James' Creek, are making from 12½ to 20 cts. to the pan. Col. Fry thinks it will pay one oz. to the hand per day.

## IDAHO.

*World*, July 10th: A short time ago a miner bought a claim on Noble's Gulch at a low price, because the owner believed it to be nearly worked out. The present owner thought differently, and in proof of the correctness of his judgment he has found the claim to be exceedingly rich and has taken out a large aggregate of gold. The claim still yields richly, and he believes that it will last in the same way for another season.

## MONTANA.

*Post*, June 29th: Scott's Bar, in Boulder Valley, turns out exceedingly favorable.

The St. Louis and Montana Cos. at Flint Creek, have commenced work in good earnest. The ground is cleared for the foundation of their works. The Camanche shows a vein of 20 ft. in width. Near the upper part of the vein is a strata one foot in width which assays from \$200 to \$2,000 per ton. The Camanche extension which lies north-east some 3,000 ft., presents a splendid opportunity for extracting quartz. On the Great Republic lode, masses of detached quartz, weighing 20 tons, appear on the outcrop. The lowest of three assays, from pieces chipped at random, returns \$15 per ton. On the Poor Man's Joy, a perpendicular opening has been made, and the material above and below a portion of the vein has been removed, showing the quartz to be four ft. thick, solid as a piece of glass, of a beautiful dark color. The ore assays from \$200 to \$1,000 per ton.

The Champion ledge is six ft. wide, four of which yield from \$150 to \$600 per ton. The shaft is 12 ft. deep, and the crevice is beautifully defined. Two men in the employ of J. W. Whitcomb, a few days ago, discovered a rich vein of silver.

Oscar Totten lately sluiced out \$21 in a few hours, from dirt drifted out of the flat north of Broad street.

In Hereford Gulch quite an excitement was started lately, by some parties sinking a shaft in the gulch, panning out from 30 to 50 cts. to the pan. Ten tons of furnace lead from the Argenta works has been sold, for filling the rollers in the Chilean mill, at Summit.

On Mansfield's claim, drifts recently run have yielded as high as \$8 to the pan, and a claim just opened in the main gulch has prospected \$4 to the pan.

A new lead has been discovered near the head of Dry Gulch. The ledge is seven ft. wide.

*Helena Gazette*, June 20th: On Tuesday last, a gold bar containing over \$10,000 was run by Bohm & Molitor, for Rhine & Ridlick. The firm of Bohm & Molitor received, at their assay office, from the 17th to the 21st of this month, 4,477 ozs. of gold to be run into bars, making in round figures the nice little sum of \$80,586.

Messrs. Tutt & Donnell, last week, had a bar of gold run at the assay office of Bohm & Molitor, from dust taken from Henderson Gulch, which is valued at \$6,673. The same firm had another bar of \$1,600 cast last week.

## NEVADA.

## Esmeralda.

Belmont correspondent of the *Bulletin*, of this city, June 22d: An Eastern company are now putting up a 10-stamp mill at Hiko. The Crescent Co. are also building a 5-stamp mill. Others will be put up during the season.

## Humboldt.

*Unionville Register*, July 13th: The Rochester Co. are running a new drift, rather than timber the old one. The drift has been run 57 ft. They are hourly expecting to tap the vein.

The Essex Co. is rushing things generally in opening its mine and erecting its mill.

The De Soto Co. is again at work on its mine in Star Dist. It is the intention to take out the ore in sight, and if it proves as good as appearances indicate, the Sheba mill will be put in operation on it.

J. Ginea has purchased and shipped a 10-stamp mill to be erected near Winnemucca, on the French Ditch.

Mr. Pease, now in the East, will soon be on his way back to Humboldt, with ample means for the development and working of his mines near Winnemucca. He will erect a mill.

The Mountain King Co. have commenced work on their mine in Echo Dist.

## Pahranaagat.

*Georgetown Miner*, June 27th: Mr. Nichols of Pahranaagat, one of the owners of the North American lode, recently laid upon our table some specimens from the lode named. Two assays made from it recently gave return respectively of \$1,600 and \$2,000 per ton.

## Reese River.

*Reveille*, July 8th: The conditional sale made some two months ago of some of the best locations in Morey Dist., for \$24,000, to the agent of a St. Louis company, has gone by default of the parties not coming to time. Several of the ledges have been opened to the water line showing a fair quantity of milling ore.

Work is progressing on the Northumberland ledge which is now the most fully developed ledge in Northumberland District. Some 30 tons of ore have been extracted. Two tons of ore of the average product of the ledge have been worked at the Parrott mill, with satisfactory results. After paying the cost of mining \$10 per ton; of transportation, \$20 per ton; of milling, \$45 per ton; and the loss of 20 per cent. in reduction, a balance of \$8 per ton was left for the owners.

The mill of the Mount Tenaho Co., in Cortez Dist., will be put in motion this week, with repaired and improved machinery and 300 tons of good milling ore on hand. The old Wheeler pans have been replaced by the Varney pan or tub, of which there are six, and two settlers, and the mill has been put in an efficient condition. A force of 30 men are employed upon the Cortez Giant, the principal mine of the company, which is so fully opened that there will be no difficulty in keeping the mill supplied. The district presents a lively appearance, which is likely to increase before the fall.

The new and powerful works at the Florida mine have been completed, and were fired up in the presence of a number of persons yesterday.

July 9th: The new engine at the Florida mine is from the foundry of T. & J. Loche, of Oroville, California. It is a remarkably simple, horizontal engine of the capacity of 50-horse power. Taken as a whole, the new machinery on the Florida mine is the most simple, yet the most complete in the dis-

**Mining and Scientific Press,**  
COMMENCING JULY, 1867.  
**DEWEY & CO., Publishers.**

Issued every Saturday, at our Book and Job Printing Office, 505 Clay street, corner of Sanson, San Francisco. Terms in Advance.—One year, \$5; Six months, \$3; Single copies, 15 cents; Monthly Series, \$3.50 per year, or 65 cents per number. Back Volumes from January, 1864, \$3 per volume; bound, \$5 per volume.  
The Mining and Scientific Press is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal on this coast. The individual character and reputation of its constant patrons throughout the entire coast is one of the best recommendations of its merits and value as a medium of intelligent progress and prosperity.

**From Sierra and Nevada Counties.**

BY A TRAVELER.

**EDITORS PRESS:**—I am traveling too rapidly to be of much service as a correspondent. However, the following item may be of some service.

Throughout the mines of Sierra and Nevada counties there is a general complaint of dull times. In order to account for this, it is not necessary to suppose that the mines are failures, but that business is assuming a legitimate basis.

The gravel mines at Howland Flat are being very extensively worked. The Union mine, owned by Stroh & Moyle, employs about seventy-five men. In this mine, from the foot of an incline 360 feet in length, a main tunnel, provided with a double track, is run directly into the Table Rock hill 3,000 feet. The pay dirt lies upon the bed rock, and varies from about two and one-half feet to seven or eight feet in depth. Work has only been done on the lower side of the main tunnel; but there the pay dirt is still being extensively breasted out. About 400 car loads of dirt are taken out each day, which pay, on an average, a dollar a load. The cost of removing and washing is estimated at sixty cents per load. Water power (Fredenburr's hydraulic wheel) is used to raise the cars up the incline. Ventilation is provided for by means of an air shaft and gallery. At first, a fire was built at the bottom of the shaft, in order to create a current of air; but this being ineffectual on certain occasions, other experiments were tried. An inch of water falling down the shaft has at last obviated all difficulties. This is an old mine, and will pay well for years to come. Other claims are being extensively worked, and a new tunnel is being made in the Hawkeye.

On the Sierra Buttes, a new quartz ledge has been discovered, and is claimed by Beard & Martinez. Specimens taken from the surface are remarkably rich.

In Sierra Valley, notwithstanding the attacks of a great swarm of crickets, the hay and grain crops look finely. Last year about 30,000 bushels of grain were raised. This amount will probably be reached this year. The crickets are leaving the valley towards the southwest.

The winter at Meadow Lake has been so severe that work in the mines and mills has been much delayed. Experiments are being made in the endeavor to find a practical method of extracting the gold from the sulphurets, in which the ledges here are very rich; but as yet no means have been discovered. There is yet some snow on the trails leading from the place, but none in the streets. The ice on the lake has broken up, and is fast disappearing.

The travel between Nevada and the mining camps east of that place is very large, and the just inference is that prosperity reigns in that direction.  
Yours,  
C. A. W.

**HELPING ONE ANOTHER.—AN INCIDENT FOR THE TIMES.**—Chickering & Sons, piano forte makers, employ some 300 mechanics, and many laborers, and, as a matter of course, their weekly disbursements are large. On a certain pay day, some two or three years ago, in consequence of the non-arrival of funds due at a distance, they were obliged to expend the funds in hand in the redemption of matured paper, and consequently had to forego the pleasure of paying their hands their accustomed weekly allowance. What did the men do then? Did they strike? No! but like rational mechanics, they met, consulted together, passed resolutions expressing sympathy with and confidence in their employers, and tendering them a loan of \$6,000 or \$8,000, the proceeds of their own savings.

**MISSISSIPPI IN THE WAR.**—It is said that Mississippi sent 75,000 men into the Rebel army during the war; 5,000 more than her entire vote. She lost of these 27,500. The black population is now 50,000 larger than the white. In some of the counties, the negroes are two to one, in some three, and in others four, five, eight, nine and ten to one.

white, liney looking deposit brought up from the bowels of the earth by the boiling waters of Steamboat Springs, which they mix with equal quantities of a peculiar species of fire-proof clay, discovered near Washoe Lake. They expect these bricks will stand anything in the shape of heat, short of that of the infernal regions. They have already smelted out considerable quantities of pure metal, which contains \$250 per ton, silver.

Within the limits of the city, below the Central mills, nearly 3,000 ft. of sluces have been put up during the past month.

July 11th: The mill of the New York Ore has just cleaned up a run on Veni Vidi ore that yielded \$80 per ton.

July 13th: Wells, Fargo & Co. have shipped from their office during the last week, 7,068 lbs. of bullion, valued at \$220,976.44.

July 16th: The Gould & Curry mill is at present undergoing a thorough overhauling. By the changes about to be made a saving of 10 cords of wood per day will be made.

**OREGON.**

Dalles Mountaineer, June 29th: The new mill ordered at the Oregon Foundry, by Mr. Porter for Canyon City, will be of eight stamps, and capable of crushing eight tons of rock per day. The L. X. L. lead at Prairie Diggings, is attracting much attention.

The lawsuit between the surface or placer miners, and the quartz locators has been amicably settled, the quartz company buying on all interest of the placer mines for \$3,300. A prospecting party is talked of, to visit the Crooked River country, so that before fall we may expect to hear of the place being found, where the emigrants of '45 hammered out the gold on their wagon tires.

The hydraulic diggings discovered last fall, near Otter Bar, are reported to be paying well and are quite extensive.

Sentinel, June 15th: Crandall, Childs and Crane, of Josephine Co., expected to make their first run on Monday last. The ore will be reduced to "regulus," and transported to Crescent City for shipment to the East. Some of the ore is said to assay \$18 gold per ton.

The Wickenburg correspondent of the San Bernardino Guardian, writing June 20th says: The Vulture 20-stamp mill continues to run with the greatest success, crushing 36 tons of quartz daily, the rock yielding \$70 per ton. Hitherto the most simple apparatus has been used, but concentrators and a desulphurizing furnace are in course of erection, which will make the yield considerably more. The quartz is hauled 15 miles, to the mill on the Hassayampa, for \$10 a ton, and fuel is furnished at \$8 per cord. Their ledge is 15 ft. in width at the depth of 150 ft., and equally as rich as that taken from the surface. On the surface it is opened up to Smith's, the adjoining west claim, and found, if anything, improving on his line. Some 60 men, Americans and Mexicans, are employed on it.

**UTAH.**

Salt Lake Vedette, July 6th: A party started on the 3d, in the wake of Lewis Robinson and company, to the Green River country, to find out all they can about the gold prospects of that country.

The editor has been presented by A. A. Hurst with a chunk of argentiferous galena, weighing 100 lbs. It is from the North Star lode, and contains \$34.57 silver. [We hope the attack is not chronic.—Ed.]

**WASHINGTON.**

Dalles Mountaineer, June 29th: Last Thursday a party of five Freuchenmen left our city for the Wenatche mines over in Washington Territory. They went well prepared with all the necessary implements for going to work, and provisions to last several months.

**SMALL POX.—IS IT A FACT.**—It was stated during the prevalence of the small-pox in St. John, New Brunswick, two or three years ago, that not a single case of that leathsome disease occurred in any house in that city that made use of gas for illuminating purposes. It is well known that gas is a powerful disinfectant, and hence it is but reasonable that it might exert an important influence in warding off infectious disease. It was stated, on the authority of a distinguished physician in that city, at the time alluded to, that a person might contract the disease abroad, and take it to his home where gas was freely used, without danger of communicating it to any member of his family. May not this statement be worth inquiring into at a time when this disease is so liable to be inflicted upon the inhabitants of this city, from the presence and constant arrivals of persons of filthy and loathsome habits.

tract. The smaller apparatus, formerly employed on the Florida mine, has been transferred to the Sherman shaft, until more powerful machinery is ready to take its place.

July 11th: The mines in Danville Dist. develop fairly as they are opened. The Young America ledge, which belongs to a St. Louis company, has been cut through the overlying limestone and down into the granite and porphyry formation, in which the vein matter is better defined and the ore of a richer quality. Work is going ahead upon a number of ledges with very fair promise of success. At Hot Creek matters are brightening up in a decided manner. The machinery of the Union mill from Austin has arrived at Hot Creek. It is the design of the owners to have it running in 90 days.

July 13th: The ore of the St. Louis mine is being hauled to the Keystone mill for reduction. A contract has been let to responsible parties for the delivery at the mill of a large lot of ore monthly.

Silver Bend Reporter, July 13th: A splendid 20-stamp mill will soon be erected at Hot Creek, by J. Miller, agent of the Boston & Reading Co. The greater portion of the machinery is new upon the ground. Heretofore considerable quantities of ore have been hauled through Hot Creek Dist. to Austin at great cost—not less than an average of \$80 per ton—for transportation alone. Three splendid mines have already been developed in the district and show large quantities of ore that good judges estimate will yield from \$100 to \$150 per ton. The predominating ores are kerargyrite, stetefeldite, and black sulphurets of silver. There are several other mines that indicate great value upon which a vigorous system of development is now prosecuted by substantial companies. Messrs. Gager & Selover, of the Providential Co. at Austin, are developing the Het Creek and Gazelle ledges with the most flattering prospects. J. C. Johnson's Silver Light has been sunk upon to the depth of 35 ft., with splendid results.

Work is being vigorously pushed forward on the Transylvania ledge, which was recently bought by an Eastern company. First class reduction works will be immediately erected at a site heretofore occupied by Olds & Crowell for a sawmill. The engine is of 60-horse power, with two large boilers, and is capable of driving a 20-stamp battery and its necessary machinery. Roasters will not be built until it is determined that the ore cannot be profitably treated by the ordinary wet crushing process.

Work has been suspended at the La Plata reduction works in obedience to orders received from the East, the headquarters of the company. The mines of the company are the Twin Ophirs and the Fairmount, and are unsurpassed by any in Central Nevada.

The Belmont correspondent of the Bulletin of this city, under date of June 22d, says: The Cortez Co. in Cortez Dist., employ about 50 hands. The Cortez ore, so far worked, has yielded at the rate of \$140 per ton. The mines will afford large quantities of \$100 ore.

The ore now being crushed from the Murphy mine, in Twin River Dist., yields between \$90 and \$100 per ton. By careful assorting, \$300 ore could be obtained from the mine. The rock is dry crushed. The mill has a capacity of reducing 18 tons per day, giving a daily yield of \$2,000. The ledge has widened from 16 ft. at the surface, to a width of 20 ft. in the lowest level.

A new 40-stamp mill will be erected this summer in Silver Peak Dist. The mill will be propelled by two 100-horse power engines. Each engine will have two boilers weighing 10,000 lbs. each.

The Combination Co. have 3,000 tons of ore, all of high grade, lying on their dump. Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

Enterprise, July 10th: Dall's mill in Washoe Valley, which was lately destroyed by fire, is now nearly rebuilt, occupying the same site, as formerly. The southern portion, intended for wet crushing, is furnished with a battery of 35 stamps, 12 Wheeler and 10 Varney pans, together with all other appliances usually found in a first class mill. The northern portion will be devoted to dry crushing and the Freiberg process, and will contain 25 stamps and 15 Freiberg barrels. The motive power will be water, in its season. A mountain stream furnishing a sufficient power for a portion of the season. During the remaining portion, steam will be used.

The Galena Smelting Works, who have had great difficulty in obtaining fire brick for their furnaces to stand the intense heat, think that they have discovered the grand desideratum, and are making brick from the

## Notices to Correspondents.

## AN ANATOMIST.—A REMARKABLE PROPHECY

FULFILLED.—Our correspondent thinks a brief notice of some circumstances connected with the life of Professor Lawrence, who, by late advices by the cable, was struck by paralysis at the College of Surgeons, London, on taking his seat, and immediately preceding the examination of candidates for diplomas, in the eighty-fourth year of his age. Precisely half a century previous, in 1817, in the same hall, in his inaugural address, he concluded with the following remarks, which we quote, word for word. They occur in making brief mention of the modern history of comparative anatomy. Hitherto, however, science has not partaken of the triumph of legitimacy. "Le Seuer has gone, with many others, to the New World. If we cannot repress a sigh when we see men of peaceful pursuits thus torn from their native soil and driven into foreign climes, let us rejoice, not only for them, but for all mankind, that such an asylum for the victims of power and oppression exists; that there is not a spot, but a vast region of the earth, lavishly endowed with nature's fairest gifts, and exhibiting, at the same time, the grand and animating spectacle of a country sacred to civil liberty, where man may walk erect in the conscious dignity of independence, that

'That lord of the lion's heart and eagle eye,'

And enjoy full freedom of word and action, without the permission of those combinations or conspiracies of the mighty, which threaten to convert Europe into one great state prison. The numerous people whose happiness and tranquility are so effectually secured by the simple forms of a free government, are the growth of yesterday. At the same rate of progress, they may reach, in our lives, as gigantic a superiority over the worn-out despotisms of the Old World as the physical features of America—her colossal mountains, her mighty rivers, her forests and her lakes, exhibit in comparison with those of Europe." The prediction marked in italics the orator and scientist has lived to see fulfilled. Of how few prophets can the same be said?

\*Alluding to the expulsion of Napoleon and the return of the Bourbons to the throne of France, in consequence of which Le Seuer was expropriated and came to reside in the United States. This episode gave rise to the magnificent peroration inserted above.

CAXTON wishes to know if any printing establishment solely conducted by females ever existed previous to the formation of *The Victoria Press* (London) Society, which was formed at the suggestion and mainly by the efforts of Miss Farnworth—patronized, however, by Queen Victoria. Perhaps it will surprise our correspondent to be informed that not only amongst the earliest patrons of printing were females, especially those connected with the Dominican Sisters, founded A. D. 1292, at Florence, but further, that in 1476 under the spiritual directors of the convent, they established a printing press within its walls, the nuns acting the part of compositors. Many works of considerable value issued from this press between 1476 and 1484, some of which are highly prized by bibliopoles.

## Triumphs of American Genius.

American locomotives, since the late award at Paris, can take their place with American reapers, American water craft, American firearms (large and small), American fire engines, American pianos, etc., against all the world. The late triumph at Paris is not the first time that the American "iron horse" has distanced the track against all competitors; as the Russians have always given our locomotives the preference, while on the Great Western Grand Trunk and other railways in Canada, if we are not misinformed, the Yankee locomotives have invariably been found superior, for their particular work, to those of English manufacture—the locomotives of both countries being employed on those roads.

Again, some six or eight years ago, when the Great Southern Railway in Chili was about to go into operation, the directors determined to give the locomotive builders of the United States and Great Britain a chance to enter into competition for the equipment of that road. Four locomotives were ordered—two from this country and two from Great Britain. Previous to their arrival, quite an excitement was gotten up with regard to the probable merits of the rival machines. In due time all four of them arrived, were put up and got ready for work. Of course the interest in the result increased with the near approach of the trial. The English operatives indulged in deprecatory remarks with regard to the bright and elegant appearance of the Yankee machines; and our people were no doubt equally ready in poking fun at the ponderous, Titanic looking engines of Johnny Bull. The trial at length came off, and to the decided advantage of the American machines.

It was found that the English locomotives were not equal to their promise. The problem submitted was to furnish a locomotive that could do a certain kind of work—it was heavy work, up steep grades with sharp curves, such as are usually encountered in a mountainous country. The English freight machine was completely exhausted by a load which the American machine carried with ease. After several trials, the former performed in eighty-eight minutes the work which the latter accomplished in less than half that time.

The defeat of the English passenger engine was even more signal. The American locomotive made sixty miles an hour, with a 200-ton train, over gradients of fifty-six feet to the mile. The English locomotive averaged but thirty miles with the same train over the same track.

The trials were made under the direction of the superintendent of the road, who was himself an Englishman, but who yet cheerfully awarded the superiority to the American machines. It will be recollected that it was mainly due to the firmness and thorough engineering knowledge of an Englishman, that the late award at Paris was made to an American locomotive. The English mechanic seems to fail in his lack of adaptability. He works by rule, and that rule is established by his immediate surroundings. The English locomotive, for an English road, can hardly be improved; but it will not answer for any other locality.

The locomotive is an English invention, but on its introduction into this country it was completely re-cast and immensely improved. The perfected "iron horse" is essentially American, and especially indigenous is that noisy embodiment of democratic huzzas—the "steam whistle." When the locomotive was fairly perfected "Young America" was just beginning to go ahead. Since that time his strides in practical inventions and discoveries have been enormous. What he has accomplished, for war and for peace, is known to all the world. No other country can show such a chronicle of the triumph of invention and industry. The records of the Patent Office at Wash-

ington are a perfect maze of wonderment in their exhibition of mechanical progress and ingenuity. The sewing machine is of itself a monument for all coming time for our inventors. Agriculture has been completely revolutionized by our thrashing machines, our reapers, our cultivators, etc., etc. Our machine shops are filled with unnumbered devices for decreasing manual labor, and for perfecting the accomplishment of work. The "sun picture" was invented in New York simultaneously with the discovery of Daguerre. It was in America where the invention was really first made of practical utility. So of the telegraph. While the European savans had been for years telling the world that the electric spark would one day become the vehicle for the transmission of thought from one part of the continent to another, it took an American to accomplish the feat, and actually put their ideas into practice; and when the first transmission of thought was made through the telegraphic wires embodied in the expressive message, "What hath God wrought?" Young America stood forth before the world, high upon the summit of six thousand years, and for the first time began to talk in a language and with a tongue which betokened that his was a people destined to renovate the race, and make an impress on the world of matter and mind which shall be as unfaceable as time itself!

THE FOG TRUMPET.—Some interesting experiments will be made with the fog trumpet at Fort Point on the occasion of the departure of the scientific expedition, which leaves this city to-day, to take possession of the "Russian Possessions." As the cutter proceeds to sea, the trumpet will be sounded, in accordance with preconcerted arrangements, while observations upon the sound, its variations, the distance at which it can be heard, greater or less, its distinctness with the use of different reeds, etc., will be carefully noted, worked up, and sent back from Victoria upon the arrival of the expedition at that point.

This trumpet was for a long time looked upon as a failure, and so considered in England until the inventor hit upon the happy device of adding machinery to it, by which it was made to revolve. Before this improvement was added, a vessel has been known to approach the trumpet from a direction opposite to that in which its mouth is directed to within a mile without hearing its sound; while approaching from the other direction, it might be heard from eight to ten miles. The trumpet, as it is now made and operated, is considered the best fog signal ever devised.

## THE WILCOX &amp; GIBBS SEWING MACHINE.

It is a well known fact that many things which appear plausible in theory are not available in practice. From the fact that the seam of the Wilcox & Gibbs sewing machine can be ripped by a certain process, when occasion requires, many may have come to the conclusion that on this account it was not only unavailable, but good for nothing. But the favor with which this machine has met during the past seven years has shown that the failure is in the theory, and not in the work. We are informed by the agent, Mr. Samuel Swift, at 203 Kearny street, that over 60,000 machines have been sold during this time, being the fourth machine in the market in point of numbers sold.

## THE IRON WORK OF THE NEW EXCHANGE.

The neat iron railings for the court and rear, and the railings and candelabras for the front steps, were furnished by John R. Sims. The heavy iron work of the building was done by Hinckley & Co., of the Falton Foundry.

PAPER BAGS.—A single factory in Treuton made one hundred and twelve millions three hundred and twenty thousand paper bags last year.

## An Important Expedition.

The Revenue Cutter Lincoln, now in this harbor, will probably sail to-day for the newly-purchased American territory, which will doubtless be hereafter known as Alaska. This vessel, as has already been announced, goes up to take formal possession of the purchase in the name of the United States Government, and to establish postal and revenue regulations, etc. The Lincoln has been especially fitted up for this trip, and sails under command of Capt. Wm. A. Howard, one of the veterans of the Revenue service, and a gentleman well and favorably known to most of our old citizens. A scientific party accompanies the expedition for the initiation of a geographical and geological reconnoissance. This party has been organized under the direction of Prof. Pierce, Superintendent of the U. S. Coast Survey, and is conducted by Mr. Geo. Davidson, Assistant, U. S. Coast Survey, as Chief. With him are associated A. T. Mosman, as Astronomer; George Farquhar, as Hydrographer, with whom is associated I. Forney as aid; — Hamel, Engineer; Dr. Albert Kellogg, Botanist; W. G. W. Harford, Conchologist; T. A. Blake, Geologist, and John Leeds, Tidal Observer. All but the four last named are connected with the U. S. Coast Survey.

This expedition is one of no ordinary importance, and its results will be looked forward to with much interest, in both a scientific and commercial point of view. It is the first regularly organized scientific expedition which has ever been sent in that direction; but the season is so far advanced that but little time will be allowed for reconnoissance. It will, no doubt, be followed by a fuller and more complete expedition another year. The fitting out of such a party so soon after the completion of the negotiations by which that territory became a part of the United States, is characteristic of the energy of the American people, and is but an earnest of the enterprise which will speedily develop and build up a commerce and trade with that distant region, which, by its contrast with that of British Columbia, will add still more to the already growing desire on the part of the inhabitants of that Province to link their fortunes with those of the United States, and thus carry the stars and stripes, without a break or interval, from the Colorado to the North Pole.

## PETROLEUM FUEL.—The results of the

experiments at the East to test the value of petroleum for steam fuel, reach us very slowly, and in a form which renders them of very little account as data upon which to found any definite opinion as to the real merits of the new fuel. The opinions expressed by engineers and others who, from their presence at such trials, ought to be able to form a very correct judgment, are very enthusiastic in favor of petroleum, but their figures are stated in a very indefinite manner. The impression is given out that any specified amount expended in petroleum will do fully as much or more work than the same amount expended in coals, giving, as the advantage of petroleum, all the gain derivable from the saving of freight room, cost of handling, etc. As soon as we can lay our hands upon anything definite in the way of figures, we shall place all the facts before our readers. In the meantime it may be proper that we should remark that there is a greater difference between the relative values of coal and petroleum in California than in the Atlantic States. While petroleum can be delivered in San Francisco quite as cheap as it can be laid down in New York, the price of coal here is nearly double the price of the same article in New York. Hence California will be immensely more benefited by the anticipated change of fuel than the Eastern States.

THE MINES OF CHILI.—There are now in operation in Chili ten gold, twelve silver, and about one hundred copper mines.

**THE SANDWICH ISLANDS.**—The telegraph informs us that a treaty of reciprocity is in progress of negotiation, by which the productions of the Sandwich Islands will be admitted into this country, duty free, and *vice versa*; and the opinion is expressed that this is merely a preliminary step to an actual cession of the islands to the United States. The former is an undoubted fact—the latter may be true or it may be false. If not true, it ought to be. These islands are the half-way house between this port and China and Japan, with which countries we shall soon have established a most lucrative and extensive commerce. They are of no use to the natives, and of but little use to any other country than this. At the present rate of decrease of the native population, the time will come within the life of the present generation, when there will be scarcely a sufficient number of natives to hold the government offices there. The annual decrease of native population in these islands is most astonishing, and there appears to be no help for it. Within fifteen years at farthest, they must, from sheer necessity, pass into the hands of foreign residents, who will naturally seek the assistance and protection of some of the great powers of the earth. Which will it be? Surely this government will not be so negligent of its own welfare as to allow any of the nationalities of the old world to get a fast hold there. It would be suicidal to do so. It would only suffer a wrong, which, sooner or later, would have to be righted at the cost of much treasure and blood. The fate of Maximilian has probably taught Europe a lesson which both that continent and our own government may profit from in the future. Let this government extend the Monroe Doctrine to these islands—let it be done definitely and authoritatively, as in the case of Mexico, and the fruit, when fully ripe, will naturally fall into our own hands, without injustice or harm to any human being.

**AMERICAN STEEL.**—It has long been thought by mechanics generally, that Americans could not produce a first-class steel, especially such as is required for cutlery or for turning tools for iron. Most of our tool manufacturers employ, for such purposes, English steel made from the best Swedish iron. By a perusal of the article on another page, giving some notice of the products of the Philadelphia Steel Works, it will be seen that we now have manufacturers in our own country who are able to compete successfully with the best English manufacture. This company manufacture a class of steel which they call the "Non-parallel," a small sample of which was recently brought to this city by Mr. William H. Daffin, and sold at the rate of fifty cents per pound, although the best English steel in the market can readily be bought for sevenpence. The fact that our mechanics are willing to pay nearly three times the price of English steel is pretty good evidence of its superiority. This high-priced steel is intended only for the purposes mentioned, and is manufactured with the greatest care, and by processes, a portion of which are a secret with the house which originated the brand. We understand that the sample lot, wherever sold in this city, has given the most unqualified satisfaction. Another lot will soon be received, and a supply kept constantly on hand sufficient to meet the wants of our machinists and manufacturers.

**PERSONAL.**—We had the pleasure of a call, the past week, from Father Cichi, late Professor of Chemistry and Natural Philosophy at the Santa Clara College. The Professor went East on the steamer of yesterday, to take a similar professorship in the College at Georgetown, District of Columbia.

**CONTINENTAL Life Insurance Company**  
302 Montgomery street, corner of Pine.

**BRANDY FROM COAL.**—We alluded, a week or two since, to the fact that Berthelot, some ten or twelve years ago, obtained brandy from coal. It may interest some of our readers to know the process by which the thing was accomplished. It is given in an English paper as follows: "Coal gas is first distilled in the ordinary way and conducted into a receiver. It then contains about eight per cent. of hydrogenous bi-carbon, in a gaseous state, which is now separated therefrom by a complicated process (not described), and introduced into a close vessel containing sulphuric acid. This vessel is then agitated until the acid absorbs all the gas. Water is then mixed with it, and the whole distilled for alcohol, which now comes over, the same as when obtained from the fluid extracts of potatoes and other vegetable sources." Our coal mines, transformed into brandy-producing districts, rivaling the best *vin cognac* of our grape-growing regions, may yet become one of the wonders of the nineteenth century. How will it sound, a few years hence, to hear the disciples of Bacchus calling for the best "Mount Diablo," or a glass of pure "Nanaimo," etc.? There is no impossibility, or even any very great improbability, that, a hundred years hence, our temperance friends may be denouncing the "villainous black mineral" with even more vehemence than they now do the proposed extension of grape culture, because of the consequent increased production of intoxicating beverages which must accompany that branch of industry.

**THE NEW MERCHANTS' EXCHANGE,** on California street, was formally opened, on Monday evening last, with interesting and appropriate ceremonies. Thomas H. Selby, President of the Board of Trustees, presented a brief statement of the progress of the enterprise from its inception to the present time. Addresses were made by R. G. Sneath, President of the Chamber of Commerce, Mr. Swrin, Mr. J. W. Stow, and others. A poem was also read on the occasion by the author, W. H. Rhodes. The building is a credit to the taste and energy of its founders and an ornament to the city. One of the novel and important features connected with the management of the new Exchange is the New York plan of writing out upon blackboards the telegraphic news from all quarters of the world, so that the observer finds the news of to-day from London, New York, Oregon, Nevada, etc., as well as from every part of California, spread out before him as soon as it arrives.

**ABOUT GUNS.**—One of the Fort Pitt Foundry big guns was shipped from New York, on the 6th of June, for this port. Sweden has adopted an American breech-loader for the use of her armies. Austria, France, and other great powers, have rejected the American patterns on account of their cost and the length of time required to adapt machinery for their construction, although their general superiority is freely acknowledged. It is said that the Chassepot rifle, after firing ten rounds quickly, becomes too hot to hold; but the Sneider arm, it is claimed, has over and over again been fired so rapidly and continuously that water thrown upon the barrel passes off in steam, and that the stock has been actually charred, without any inconvenience to the firer, and without interfering in any way with the efficiency of the arm or ammunition.

The attempted assassination of the Emperor of Russia at Paris, it appears, was a very serious affair. The ball struck the head of a horse upon which an attendant was riding, passed into the carriage, and between the Emperor of Russia and the Emperor Napoleon, wounding a lady opposite. The blood from the wounded horse spirted into the carriage and upon the uniforms of the Imperial party.

**Contributed for Our Cabinet.**

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

175.—Mr. Geo. Deitz sends us a very fine specimen of silver ore from the Cherry Creek silver mine (elsewhere noticed), in the Shuswap District, British Columbia. The specimen is a black sulphuret, very rich, and almost identical with the richer sulphurets from the Ophir mine of Nevada.

176.—Is another silver specimen, sent by the same party, and taken from Kamloop Lake, Kamloop District, British Columbia. About fifty per cent. of the bulk of this specimen consists of silica. The silver is contained in a light, arsenical sulphuret, containing both antimony and lead.

**DELICATE MACHINERY.**—The friends and patrons of Mr. Theodore Kallenberg, machinist and model maker, will find, by reference to his card, that he has removed from his old stand on Market street, to No. 10 Stevenson street, near First, where he has fitted up anew with increased facilities for unishing everything in his line.

**THE LARGEST WATER-WHEEL.**—We believe the largest diameter of water-wheel ever constructed is now running in Green Valley, Solano county, in this State. It was built by Mr. George Dingley, and is sixty-five feet in diameter. If anybody knows of a larger one, we should be pleased to hear of it.

**ASSAYER AND CHEMIST.**—A gentleman who has had considerable experience as an assayer and chemist, in this city and elsewhere, desires employment, here or at the mines. Good references given. See advertisement.

**NORTH AMERICA Life Insurance Company.**

Usual Restrictions on Occupation and Travel **ABOLISHED!**

Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.

The most Responsible and Liberal Company in the World  
**J. A. EATON & CO.,**  
Managers Pacific Branch, 302 Montgomery st.  
20v14nr5p SAN FRANCISCO.

**MARKET STREET HOMESTEAD ASSOCIATION.**—J. S. LUTT, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

**OLNEY & Co.,** Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. ncl0

**JACOB SEW,** Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street,) takes all kinds of Photographs in the best style of the art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 10v14tr

Persons desirous of obtaining the finest Wood Engravings, can procure them only by having the picture photographed on the block, by **D. H. WOODS,** No. 28 Third street. 19v14trnr

**Gold Bars,** of whatever size, if well cast, assayed for two dollars, at A. P. MOLLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint. 15v14-3m

**Perry Davis' Vegetable Pain Killer.**  
The universal remedy for internal and external complaints. At this period there are but few unacquainted with the merits of the Pain Killer; but while some extol it as a liniment, they know but little of its power in easing pain when taken internally, while others use it internally with great success, but are equally ignorant of its healing virtues when applied externally. We therefore wish to say to all that it is equally successful, whether used internally or externally, and its use is universal and immense. The demand from India and other foreign countries is equal to the demand at home, and it has become known in those far-off places by its merits—the proprietors have never advertised it or been to any expense in its introduction into foreign lands. Sold by all Medicine Dealers everywhere. 2v15-1m

**Balders' Insurance Company—**  
OFFICE IN THE BUILDING OF THE CALIFORNIA SAVINGS BANK, California street, one door from Sansome street.  
FIRE AND MARINE INSURANCE. 10v14Spqr

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with **ROSE GOLD**—thus restoring them to their original usefulness and beauty.  
Call and examine the work. Finest quality of artificial work also manufactured. 15v14-tr

**Brown's Filtering Heater.**—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone. One in operation at the San Francisco Foundry, Fremont street, where rights can be procured, or all needed information, on application, in person or by letter, to **6v14-ty AUSTIN A. WELLS, Agent.**

**Assayer and Chemist.**  
A GENTLEMAN WELL VERSED IN ASSAYING AND Analytical Chemistry, is desirous of securing a position in some assaying establishment, or would take charge of the assaying and amalgamating department of either a gold or silver mine. Steady employment, rather than high wages, is desirable. The advertiser would take his own laboratory to the mine if desired. Proper references given. Inquire at this office. 4v15tr

**THEODORE KALLENBERG,**  
Machinist, Maker of Models for Inventors, Scales, Weights, Dies, Stamps, Drawing and Philosophical Instruments, etc.  
No. 10 Stevenson street, near First, San Francisco.  
Repairing promptly attended to. 3v15tr

**D. CAMERON.**

6v12-ly

**CORNISH PUMPING ENGINES.**—What is known as the "Cornish pumping-engine," which is so extensively used in the British mines, is regarded as perhaps the best example of the application of steam as a motor which has yet been produced. This superiority is attributed to the necessity imposed upon the engineers of effecting a great economy of fuel in localities far distant from the coal fields; and again to the circumstance that the duties of the engines are regularly reported in what are called "duty papers." The duty of a Cornish pumping engine is estimated by the number of pounds lifted a foot high by the consumption of a bushel of coals. Taylor's engine reaches the high duty of lifting 110,000,000 pounds. The average duty of all the engines at work at present is 51,620,000, while the average duty of the best engines amounts to 99,000,000. This enormous power, which may be estimated at equal to the power of 5,500 horses, is employed to raise more than 9,000 gallons of water per minute from the mines and to lift a large portion of the ore which is raised. The manufacture of these engines gives rise to other and important industries, each of these large engines costing from \$10,000 to \$20,000. The machinery at one of the largest mines has been estimated to be of the value of \$375,000.

**EFFECT OF CANNON SHOT.**—A shot does make a hole of its own size through wood, but indents it, the fibres springing back after the shock. Generally, the course of shot can only be traced by a wire, sometimes by a hole as large as a man's finger. The damage most often happens in the inside of a vessel, in splintering and breaking the wood, after the main force of the shot was spent. Forts Hamilton and Richmond, which are about a mile apart, with a vessel lying between them, could not, with their guns, send shot through two feet of its timber. There is scarcely an instance where a ship was sunk by a solid shot. Hot shot and shells do the mischief; the latter will sometimes make apertures several feet in extent through the sides of vessels.

AMERICA has 80,000 miles of telegraph wires; Europe, 60,000, and India, 3,000.

**Superior Workmanship**

of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES. Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular.

25v12-3m

**THE lobster business is carried on upon a large scale at Jonesport, Maine.** About 130 persons, men, boys and girls, are engaged in a single establishment, independent of the "catchers." The firm pays two cents for each lobster delivered at their works. Five thousand are cooked daily, about 4,000 of which are put up in cans. Fifteen girls are employed in weighing, painting and labeling the cans.

**EXAMINING THE BRAIN.**—A London surgeon recently put a dog to sleep with chloroform, and taking out a piece of his skull, has inserted a watch crystal, through which he can see the changes in the brain produced by sleep.

**THE MOSQUITO.**—Each female lays annually about 300,000 ova. Being deposited on the surface of water, they are devoured by fish and other aquatic animals in such quantities as to greatly lessen the evils which follow their propagation.

**Piles! Piles! Piles!**

NOT PILES OF GOLD, NOR YET OF SILVER, SO much coveted by all men, but the BLEEDING, BLIND or EXTERNAL PILES, can be easily and speedily cured by the use of

**WOOD'S SUB-POSITORY.**  
It is a preparation totally distinct from anything heretofore offered as a remedy for this painful and often fatal complaint. The SUB-POSITORY is neither a pill, powder, wash or salve, and yet it has proved to be a certain Remedy for the Piles. Do not doubt this assertion, or delay testing the truth of it if you are troubled with the Piles—you will not be deceived in it.

Sold wholesale and retail by J. H. REDINGTON & CO., Nos. 416 and 418 Front street; GEO. GRISWOLD, corner of Mission and First streets; OLD FAMILY DRUG STORE, corner Mission and Second streets; UNITED STATES DRUG STORE, Bush street, between Montgomery and Kearny.

EUROPEAN METALLURGICAL WORKS, —AND— Practical Mining School, Bryant Street, Between Third and Fourth, SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyrites, and the (so-called) "reluctant ores," are having special attention paid to their successful treatment, assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL. The Proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business. S. P. KIMBALL, J. R. MURPHY. 10v10

J. A. BAUER, Chemical Laboratory, AND DRUG STORE, 644 Washington Street. [Established 1849.] SAN FRANCISCO.

Careful Analyses made of Ores, Minerals, Waters, Oils, Lignors, Wines, Products of Art, etc.

Pharmaceutical Preparations Made to Order. Opinions given on Chemical Questions and Oology. Particular attention paid to Analyses of all kinds, in cases where legal questions are involved. Pure Nitric Acid, Nitrate of Silver, Cold Chloride, Platina Chloride, Sodium Amalgam, Sulphate of Copper, etc., for sale. 12v14-6m

LACOUR'S SARSAPARIPHERE BITTERS

Have so speedily grown in favor that their unrivalled sale has attracted remarks and criticisms of the trade. Jealousy attributes their success to the fineness of their general style, and principally to the originality and beauty of the bottle, which was conceived and manufactured by California artists. MR. LACOUR, an energetic promoter of California resources, desired to show that California has no need of being tributary to other countries for talent or mechanical industry.

The cause of their success is the great benefit they have been to the large number who have already used them. MR. LACOUR is a graduate of the Polytechnic Institute of France, and adds to a thorough knowledge of Chemistry many years of experience; and, after a long and careful experimental study, has been enabled to offer

LACOUR'S SARSAPARIPHERE BITTERS.

They are the most efficient Blood Purifier, because they combine with the wholesome Sarsaparilla, which operates by cutaneous excretions, and other substances which gently stimulate the secretions of the lower glands and organs, render digestion easy, obviate constiveness, and remove regularly every impurity of the blood. They are unrivaled as a remedy for Scrofula, Dyspepsia, Constipation, Liver Complaint, Nervous Affections, Colic, Intermittent Fevers, and all diseases arising from impurity of the Blood or Costiveness.

Who Takes Them?

The Old Man Takes them as a gentle stimulant and mild rejuvenator. The Young Man Takes them to regulate his system, prevent disease, and stimulate to new life his overworked body. The Young Woman Takes them to secure regularity in her habits; to tint her cheeks with the bloom of health, to give a sparkle to her eyes, and sweetness to her breath. The Husband Takes them to promote vitality, give strength to the body, peace to the mind, and with his health, wealth and comfort to all his family. The Wife Takes them to invigorate and strengthen her system, and as an aid to aature in regulating her periodical sickness.

Children Take them as a gentle, yet effective tonic. The Dashaury Takes them as a mild, pure stimulant, containing none of the deleterious, essential and tussil oils of forbidden drinks. The Inebriate Takes them to give tone to his poisoned stomach and allay the fearful longings for strong drink with a stimulant that does notadden or destroy. The Traveler Takes them to prevent sea sickness, and secure his health against change of climate.

Everybody Takes Them! PRO BONO PUBLICO: 2v15-6m

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & CO., Patent Agents. San Francisco, May 1st, 1866.

Postage.—The postage on the MINING AND SCIENTIFIC PRESS to any portion of the United States is twenty cents per annum, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (marked via Bremen and Hamburg line), three cents per copy, prepaid. Single copies to any address in the United States, two cents.

JOEL F. LIGHTNER, Secretary. Office, No. 60 Exchange Building, N.W. corner Washington and Montgomery streets San Francisco. jy15

Sophia Consolidated Gold and Silver Mining Company, Sonora, Tuolumne County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the eleventh day of June, 1867, the several amounts set opposite the names of the respective shareholders as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Lists names like E. W. F. C.; Welles, Samuel, etc.

And in accordance with law, and an order of the Board of Trustees, made on the eleventh day of June, A. D. 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by J. Middleton & Son, 404 Montgomery street, San Francisco, Cal., on Friday, the twenty-sixth day of July, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

DAVID E. JOSEPH, Secretary. Office, 641 Washington street, San Francisco. jy15

St. Louis Silver Mining Company, Cortez District, Lander County, Nevada.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the fourth day of May, 1867, the several amounts set opposite the names of the respective shareholders as follows:

Table with columns: Names, No. Shares, Amount. Lists names like Baldwin, John E.; Berry, Henry; Cassel, John F., etc.

And in accordance with law, and an order of the Board of Trustees, made on the fourth day of May, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the saleroom of Manrice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on Tuesday, the second day of July, 1867, at the hour of 12 o'clock, noon, of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary. Office, 331 Montgomery street, San Francisco. jy16

Postponement.—The above sale is hereby postponed until Monday, the 29th day of July, 1867, at the same hour and place. By order of the Board of Trustees, R. N. VAN BRUNT, Secretary. jy29

Tuolumne Mountain Gold and Silver Mining Company, Old Buchanan Ledge, Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of July, 1867, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, D. F. Verdenal, offices, 22 Court Block, 636 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirtieth day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the thirty-first day of August, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, D. F. VERDENAL, Secretary. Office, 22 Court Block, 636 Clay street, San Francisco. jy15

Whittoreh Gold and Silver Mining Company, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of June, 1867, an assessment of fifteen dollars (\$15) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, D. F. Verdenal, offices, 22 Court Block, 636 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirtieth day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the thirtieth day of August, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, N. O. FASSETT, Secretary. Office, N. E. corner Front and Clay streets, San Francisco. jy15

Postponement.—At a meeting of the Board of Trustees, held June 21st, 1867, the order was rescinded (No. 7) made February 14th, 1867, was rescinded. N. O. FASSETT, Secretary. jy29

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) complicated by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business to none but active and experienced collectors. The Mining and Scientific Press Patent Agency has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired. This Amalgamator Operates as Follows: The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the amalgamated.

Sellers made on the same principle excel all others.—They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed. Mill men are invited to examine these pans and setlers for themselves, at the PACIFIC FOUNDRY, San Francisco.

\$85 for Hunter's Improved Concentrator.

The patentee is prepared to sell his Concentrators for the above price, and guarantees, when the machines are run according to directions, to give 20 per cent better results than from any Concentrator built on this Coast, and will refund the money if they will not perform what is claimed for them. Machines with copper plates, will cost \$10 extra. The Machine can be

Seen in Operation

At Booth & Co's Union Foundry, up stairs. Parties purchasing Concentrators will do well to examine before buying others of pretended merit. Persons desiring it can have a practical concentration made of fallings at any time, and prove the working of the machine.

FOR \$50.

HUNTER'S EUREKA AMALGAMATOR. For sale, the right to build and use in mills. A working plan will be furnished each purchaser. Five machines can be seen in operation at the Eureka Mill, Grass Valley. The cost of the iron for the machine, without the iron-box, is about \$100. The box will answer of wood. By reference to the Mining and Scientific Press of May 25th, a full description of the above Machines may be found. For particulars, send for Circulars, or address ANDREW HUNTER, Union Foundry, San Francisco.

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, proctored, some time since, a reissue of the Patent, bearing date January 9th, 1856.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. BLAKE & TYLER, Agents for the Pacific Coast.

QUARTZ MINERS, MILLMEN,

And others contemplating the erection of Reduction Works, for either Gold or Silver Ores, your attention is called to a new, superior

First Class Mill,

In all respects, with Pans and Separators complete. The Mill is adapted for 20 or 40 Stamps.

Full particulars may be had by calling on Messrs. Palmer, Knox & Co., Golden State Foundry, or J. B. HITCHCOCK, Millwright, Russ House.

Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

PICKERING'S GOVERNORS For Steam Engines.

Giffard's Injectors, For Feeding Boilers.

STODDART'S IRON WORKS,

Beale Street, San Francisco.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

WM. P. BLAKE,

Corner First and Mission streets, or Box 2,077 SAN FRANCISCO.

NELSON & DOBLE,

AGENTS FOR:

Thomas Firth & Sons' Cast Steel, Files, Etc., Shear, Spring, German, Plow, Blister and Toe Calk Steel; manufacturers of

Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools,

319 and 321 Pine Street,

Between Montgomery and Sansone, San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.

The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Shattering Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the operators are enabled to offer the best machines to the public at the following low terms: No. 1.—Or 10 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600 No. 2.—Or 15 inch Crusher, capable of similarly putting through five to six tons per hour. \$850 No. 3.—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour. \$1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the largest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: JAMES BRODIE, Esq., San Francisco.—My Dear Sir: I receive me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1856. For particulars will be afforded on application to the subscribers. Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1856, the penalty charged for using the same will be raised to the sum of \$100 per Barrel. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 25th, 1855.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR BRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations affixed on application to the subscribers. A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1855. BRODIE & RADCLIFF, Express Building, 402 Montgomery street, San Francisco.

LEFFEL'S American Double Turbine WATER WHEEL.

THESE WHEELS, UNEQUALLED AND UNRIVALED IN THE United States or the world, have been fully tested on this coast, more than forty being in use, at this date in California and Oregon, doing all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc. CALIFORNIA REFERENCES.—E. Stockton, Folsom; O. Simpson, Oakland (Mill at Clear Lake); Morgan Coville, Lexington, Santa Clara County; J. Y. McMillan, Lexington, Santa Clara County. Send for Circular to KNAPP & GRANT, 267 1/2 Washington street, San Francisco.

Quartz Mill Construction and Superintendence

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a quartz Mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets, and the treatment of rebellious ores is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address: F. M. SHAW, San Francisco, care Mining and Scientific Press. 267 1/2 3m

Notice to Miners, Well-Borers and Water Companies,

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest Improved patterns, for vessels of all classes. Also, Ship Plumbing done. M. PRAG, 8v13-ly Stove Store, No. 125 Clay street, below Davis.

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

HEALTH! HEALTH!

Taylor's Stench Traps and Garbage Baskets,

To prevent this, purchase one of Taylor's Stench Traps and Garbage Baskets, and promote the health, comfort and cleanliness of your family. For description see Mining and Scientific Press, April 6, 1857. Sold wholesale and retail by TAYLOR & SONS, at No. 429 Pacific street, San Francisco. 15v14tf

THE CELEBRATED Self Generating Portable Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivalled, burning with undiminished brilliancy in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 15v14-2a.

E. O. HUNT, Manufacturer of Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have all the sails so arranged as to turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, or means of the brake lever at the foot of the mill, by any person.

HUNT'S SELF REGULATING MILL is strong, durable and cheap. It is provided with means for stopping in the most violent winds. This mill is well known throughout the State.

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double-Acting. Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Table built to order. No. 28 Second St., and 108 and 110 Jessie St. Saa Francisco. 2v15qy

ROOT'S PATENT FORCE BLAST BLOWER.

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 per cent less power than any Blower now in use. For further particulars, address ROBERT BLAKE & CO., Stockton; or Wm. T. Garrett, corner Mission and Fremont streets, San Francisco. 1v15 10ptf

National Mineral Land Law, Instructions, Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the United States Registers and Receivers and Surveyors General, from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address DEWEY & Co., office Mining and Scientific Press, San Francisco.

The Fire Engines of Europe.

Nothing strikes an American with more surprise in a large European city than the backwardness manifested there in the introduction of appliances for the extinguishment of fires. Even in the British Islands, according to the Mechanics' Magazine, there are but two cities which have ordered a second steam fire engine. A Paris correspondent of the Alta, of this city, gives the following description of the Fire Department of Paris, as it appeared upon a recent public occasion:

They are dressed in the same manner as Lafayette Hook and Ladder Company used to be in your city before the Paid superseded the Volunteer Fire Department— brass helmets and all that sort of things—and are a fine, well-drilled body of men. Each company, attended by its band, marched in front of a pavilion for inspection, worked their engine, and then started off on a dead run from the field. The functionaries who perform the duties of those hearty young fellows who, when the engine is being whirled through the streets, shout with stentorian lungs, "Lively, now boys, lively!" "break her down, boys! break her down!" are furnished with trumpets, and keep up a very inspiring toot while the company is in motion. In point of melody, I must say it is an improvement upon our way of doing things. In relation, however, to the apparatus of these fire companies, I am not prepared to go into great ecstasies. It resembles more a bath tub on wheels than a fire engine. It is drawn by six or eight firemen easily. The balance of the company are furnished with buckets! When a fire breaks out, these latter station themselves in a line to the nearest supply of water, and pass bucket after bucket to the engine, where it is by hand labor forced into the hose. They have no idea of suction hose in France. They have been passing water in buckets to their engines for centuries, and they will stick to that way of doing things until the Emperor takes the matter in hand, and woe to the unfortunate youth who, returning late from a party with white vest and white kids, stumbles upon the fire line. To work he has to go, and that without cessation, until the fire is put out. As might naturally be expected under these circumstances, people in Paris, instead of running to a fire, run away from it with the utmost celerity. To the steam fire engine the people of Paris will, of course, have to come in the end, no matter how strongly they oppose innovation. So efficient is their mode of dealing with the "devouring element," that a company of "pompiers" (as they are called) is stationed in almost all the public buildings. The fire department of the Exposition is composed of more men than are considered necessary to insure the safety of the city of San Francisco. Several thousand men are now kept in Paris lounging about their quarters, with brass helmets on their heads, who might be engaged in some branch of productive industry, because there is an objection to keep up with the progress of the times, or, more properly speaking, a disinclination to accept new ideas, particularly if those new ideas are of foreign growth.

CORAL JEWELRY.—Coral jewelry has become so fashionable in Paris that it commands, even in the rough, a price equal to about twenty times its weight in gold.

The rose pink variety commands the highest price. In one of the show cases at the Paris Exhibition, there is a necklace, consisting entirely of coral, which is valued at \$2,300 in gold. The same show case contains a great variety of other coral ornaments, such as bracelets, ear-rings, cameos, etc. Their great cost is due to their exquisitely delicate and elaborate workmanship. Heretofore jewelry of this description has generally been conspicuous for its clumsiness and exceeding want of taste. Under certain conditions, coral is an excellent material for art. Its beautiful color, its solidity of texture, resistance to atmospheric action, etc., greatly recommend it. There are some fifteen varieties of coral known to commerce, but a small portion of which are fit for artistic finish. Natural coral of the most choice variety is worth twenty times its weight in gold, and has been for years. One of the finest specimens in this country is to be found in the cabinet of Yale College.

**WHITE COPPER.**—The London Mining Journal, some five or six years ago, gave the following erroneous statement about the alleged manufacture of "white copper" by the Chinese. The statement was vouched for by a correspondent, and was given as follows:

Tradition says that the Yun-Nán district formerly produced white copper, the ingots of which that are preserved being of a fine grain, and harder than that at present obtained. The copper when raised is red, and from the description given by the various workmen, the writer learned that the ore, when taken from the mine, was placed on a layer of wood, covered also with wood and kindled. At the Lon-Kon-Tehang mine this operation was repeated seven times, in others five, and in some only three times, experience being the only guide as to the number of times necessary for each description of ore. The ore thus heated was reduced to powder, or small grains, and 700 pounds taken therefrom was placed in a large furnace on a bed formed of a mixture of coal and oak charcoal, covered with some of the same mixture, and kindled; this operation was not repeated, but if the ore were of good quality, the result would be from 220 to 300 pounds of copper, in a roughly formed ingot. Four small furnaces were then brought into requisition in place of the larger one above mentioned; a fact that claimed particular attention, and a point upon which the workmen were unanimous, was, that neither coal nor oak charcoal ought to be employed in this part of the operation, but that it was absolutely necessary to use fir charcoal. From this rough ingot eighty pounds were taken, and twenty pounds placed in each of the furnaces, when, if the ingot were good, it gave about 12½ pounds for each furnace. Two of these pieces were taken and again submitted to the fire, with five pounds of the best red copper, a great heat was obtained, and about nine pounds of copper was usually the result. These preparatory operations being completed, three pounds of the double refined and three pounds of the triple refined, mixed with 2½ pounds of the best red copper, were fused, and when the molten iron began to show a white heat, one ounce of tin (kienne) was thrown in, and the copper almost instantaneously became white; the product, if the operation was well conducted, being about 4½ pounds.

**MONUMENTS TO GENIUS.**—There are to be monuments erected in the city of New York, for two of the greatest geniuses of the world, and claimed as the children of that city—Robert Fulton and Professor Morse—inventors of the steamboat and the telegraph.

**BELLS.**—It is said that bells will prevent the depredation of dogs among your sheep. A dog that knows enough to kill sheep also knows enough to be still and sly about it.

**Our Patent Agency.**  
The PATENT AGENCY of the MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

**HINKLE & CAPP'S**  
**CENTRIFUGAL ORE GRINDER AND AMALGAMATOR.**

Patent dated April 16th, 1867.

For Grinding and Amalgamating Charges of Ore.

Arranged as shown in the first engraving, the pan is adapted for grinding and amalgamating separate charges of ore of 800 lbs each, doing its work rapidly, thoroughly and effectually.

This sectional engraving exhibits more clearly the arrangement and shape of the grinding parts of the machine. It, and the other engravings, will be more clearly understood by reference to the accompanying explanation.

Half Section or Top View.

**The Centrifugal Ore Grinder.**

This new GRINDER and AMALGAMATOR is extremely simple and compact in its construction. The principle availed of is entirely novel. The grinding is effected by perpendicular mullers, pressed laterally by centrifugal force against perpendicular iron dies, fitted to the inner sides of the pan. It is to be run at a speed of from 60 to 80 revolutions per minute, according to the hardness of the rock to be crushed. The pressure upon every part of the grinding surfaces is direct and uniform, and they wear with straight and true faces from first to last, conforming also to the shape of the sides of the pan, so that the work performed with old mullers and plates is as thorough and perfect as with new ones. The pulp enters readily between the mullers and side dies, the pressure being light in front and heaviest at the heel of the muller, there is no strain upon any of the parts, and no liability to breakage or disarrangement, and no wear except that which is useful on the grinding surfaces. The work done is performed without jarring, jerking, straining or clogging, with extreme regularity, the pulp being of great and uniform fineness. It is not liable to be clogged, nor to be obstructed, stopped, impeded or broken, by coarse pieces of rock, pebbles or iron, accidentally introduced with the crushed ore, as these can readily pass each muller separately, without interfering with or affecting the other mullers, each of which is independent, or can rest upon the bottom below the mullers, without inconvenience, as the arms play freely an inch above the bottom of the pan. It is more readily cleaned up than any other pan, as each muller can be lifted out separately by hand, and there is no necessity for lifting the revolving cone or driver, which is also easily turned, there being no friction when not in use, or rapid revolution. The bulk of the mercury is not ground up with the rock, but lies below the lower ends of the mullers in a groove, and in another groove on the cover of the pan, where all the pulp and metal passes continually over it without cutting or carrying it away. The mullers and side

For Grinding and Discharging Continuously.

Arranged as shown in the second engraving, all the interior grinding parts being the same as shown in first view, this unit is adapted for receiving and grinding and discharging continuously crushed quartz as fast as supplied by a five-stamp battery, with No. 4 or 5 screens. A "sluicer," or some similar contrivance, to carry off the clay, slime and surplus water, is to be placed between it and the battery.

EXPLANATION.—E, muller-halter; F, muller plate or shoe; G, side die; H, supporting lip; D, bearing surface; I, feeder; X, weight to counter-balance wear of muller plates, or shoes; L, cover used in working charges of ore. The dark shade on the bottom of the pan represents one of the grooves for mercury.  
We claim all these advantages for our Pan, and that it will do more and better work, with less power, and less attention and manual labor, more rapidly and with less expense, than any other pan or muller made for the same purposes, and adapted to be of equal or greater capacity. We will sell them for use on condition that if, when fairly tried they fail to answer these promises, they may be returned.  
For full description and illustration, see Mining and Scientific Press, June 15, 1867.

**Hinkle & Capp's Centrifugal Ore Grinder and Amalgamator**

May be seen in operation, and examined, at the European Metallurgical Works, on Bryant, between Third and Fourth streets, San Francisco, where all interested in mining and milling operations are invited to inspect it. Its weight, as arranged for continuous grinding and discharge, with extra set of six mullers, is about 2700 lbs.; or as arranged for grinding and amalgamating single charges of 800 lbs. of ore, also with extra set of mullers, about 3,000 lbs. Price, as above, completely fitted and ready for use, either way, \$500, gold coin.

For further particulars, apply by letter to PHILIP HINKLE and CHARLES S. CAPP, No. 513 Clay street, below Montgomery, San Francisco, Cal. or personally to the above, or S. P. KIMSALL, Esq., at the European Metallurgical Works, on Bryant street, between Third and Fourth streets, or at the Miners' Foundry, First street, near Folson, where they are manufactured.

—AND—  
**ZOOLOGICAL GARDENS.**  
THESE BEAUTIFUL GARDENS ARE VISITED DAILY by hundreds of the pleasure-seeking public, and all agree in pronouncing them the best and only first-class suburban resort on the Pacific Coast.  
The extensive grounds are covered with the rarest trees and shrubbery, making it a most desirable spot for small parties wishing to enjoy a Ple-Nie.  
To all departments new attractions are being constantly added.  
These Gardens are accessible by the Howard, Folson and Market Street Cars.  
Entrances on Mission and Valencia streets, between Thirtieth and Fourteenth. OPEN EVERY DAY.  
Admission to all parts, 25 CENTS. Children, under 12 years, half price. 24v14qr

**THE WILLCOX & GIBBS**  
IMPROVED NOISELESS  
**Family Sewing Machine**  
Challenges the world. It has beaten the Florence badly. Come and see it, or send for Report of the trial.  
**SAMUEL SWIFT, Agent.**  
13v14-6m  
203 Kearny street, near Sutter.

**Pratt's Abolition Oil.**  
FOR ABOLISHING PAIN—THE BEST REMEDY IN existence for Rheumatism, Neuralgia, Paralysis, Headache, Toothache, Sore Throat, Diphtheria, Wound, Swollen and Stiff Joints, Contracted Cords and Muscles, Cramps, Colic, Diarrhoea, Cholera, Pains in the Breast, Lame Back, and all aches and pains. It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 50 cents and \$1 per bottle. For sale by all dealers in medicines. Sole Proprietors, A. McBOYLE & CO., Druggists and Chemists, 322 Sacramento street, opposite What Cheer House, San Francisco. 10v14-1y

**GOVERNMENT HOUSE,**  
Corner of Sansome and Washington sts.  
SAN FRANCISCO, CAL.  
THE STREET CARS PASS THIS HOUSE IN every direction every ten minutes.  
The rooms of the House are well furnished, large and airy, are let by the month, week or day, and are kept in superb order. There is a restaurant attached for ladies and families, where persons can board for one-half they are required to pay at hotels.  
Vv13-6m

**GLASGOW**  
**IRON & METAL IMPORTING COMPANY,**  
Nos. 25 and 27 Fremont street, near Market,  
SAN FRANCISCO.  
Bar and Sheet Iron; Boiler Plates and Tubes; Gas and Water Pipes, Gas Fittings, Anvils, Cast Steel, etc. 18v14-2m

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.  
These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.  
Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and at the same expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.  
All sizes on hand from 3 to 30 horse power, with and without carriages.  
Also, Portable Saw and Grist Mill's.  
For sale by  
**TREADWELL & CO.,**  
9v14-6m15p  
Corner of Front and Market streets

THE PARIS EXHIBITION.—Bayard Taylor in a letter to the New York Tribune, under date of May 14th, says that the visions of overflowing hotels, of crowds of bewildered strangers looking for lodgings, of impositions, of unheard-of expenses, etc., have happily proven false. Comfort and moderate charges are the rule. Mr. Taylor, who has seen all the great International Exhibitions which have been held up to the present time, expresses the opinion that the present one, though it is not quite equal, in its general features, to the London Exhibition of 1851, is nevertheless fully entitled to be considered a success. In some respects it is short of what had been anticipated, yet in others it is far more than could have been expected. He thinks that these Exhibitions are held at too frequent intervals—that once in ten years is as often as the world requires such enormous undertakings.

DAUGHTERS.—Pulu mattresses left lying upon shed roofs and other places in the rear of dwellings are very liable to be set on fire by flying sparks, and thus kindle dangerous fires. Several accidents of this kind have recently occurred. Pulu takes fire from a spark almost as readily as tinder.

MINING AND SCIENTIFIC PRESS.—This valuable journal has closed its fourteenth volume and entered upon its fifteenth. It is a publication that should have a wide circulation among our mining and mechanical population. It publishes, in addition to the most complete summary of mining news, a vast amount of information on the application of science to mining and the mechanic arts. It contains notices and descriptions of all new mining processes, and all machines intended to facilitate the extraction of the precious metal from ore and rock with which it is blended. It also chronicles all new inventions, and, in most instances, contains drawings to illustrate them. To miners and mechanics it is a paper of incalculable value, and should be in the hands of all who desire to keep themselves posted in the progress being made in these departments.—*Tribune Union.*

THE MINING AND SCIENTIFIC PRESS, San Francisco, has entered on its sixteenth volume. The Press is worth its weight in gold to the artisan and the miner, and is always filled with original matter of deep interest to all classes.—*Amador Ledger, July 15th.*

BY MAIL.—The Mining and Scientific Press will be sent by mail to any part of the civilized world. In case of removal subscribers have only to inform us of the post office address of their old and new location, and the paper will be sent accordingly.

METALLURGIST.—A practical metallurgist, experienced in all branches of his business, and particularly in the manufacture of TOUGH COPPER, wants employment. His address can be had the office of the Mining and Scientific Press. 25714-4w\*

HENDY'S LATEST IMPROVED CONCENTRATORS,

FOR GOLD AND SILVER ORES,  
With Revolving Stirrers and Rotary Distributor.

Can be seen in Operation at the Union Foundry, First St., San Francisco.

Directions for Operating Hendy's Concentrators:

- The sulphurets are drawn off while the Concentrator is in motion, in the following manner:
- FIRST—Set the Pan, A, level, by its inner rim.
- SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]
- THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.
- FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

The above directions, if followed implicitly, are all-sufficient. But, strange as it may appear, the proprietor has found that, in certain cases, they have, owing to the carelessness or to the ignorance of the operators, failed to serve as a complete guide. He, therefore, in the present edition of his circular, insists upon their being followed to the letter; and in order that there may be no mistake in future, he thus elaborates and explains them:

First, then: Unless the pan is level, it is out of the question to expect it to do its duty. One would imagine that the slightest possible examination of the illustrations would be sufficient to show this. Yet, in one case, where the machine did not work satisfactorily, it was found that no regard whatever had been paid to this point! The word level is in itself precise; it admits of no latitude, and cannot be misunderstood. Nothing is easier, to a mechanic, than to place the pan absolutely and mathematically level. It cannot be necessary to dwell further upon this point.

Direction Second, viz:—"Keep the pan about half full of sulphurets," has also, in some cases, been disregarded. A moment's reflection will point out its importance. The operation of the machine is such, that grains of any kind, whatever may be their size or weight, will seek the periphery of the pan, and unless discharged, will there remain, until other grains of greater specific gravity take their place. Of course, then, at the starting of the machine, and for a short time thereafter, the periphery will be partially filled with sand. It is therefore necessary to allow a quantity of sulphurets sufficient to completely occupy that space to accumulate, before the gate is opened, and their discharge commenced. It is obvious that they will otherwise be accompanied with more or less of sand. Once properly commenced, the discharge will be continuous. It must be regulated, however, by the richness, in sulphurets, of the pulp under treatment. A little practice will enable the operator to gauge it without difficulty.

After what has been said, direction Third requires no further explanation. Direction Fourth is, to a mechanic, sufficiently explicit.

These concentrators can be set in pairs, for which a single crank shaft will suffice. Two such pairs can be so arranged as to require a driving shaft of only six feet in length. The guaranteed capacity of each machine is five tons every 24 hours. Eight tons, however, can be and has been put through in that time. The small proportion of sand which the sulphurets carry, when thus rapidly concentrated, is not an objection but rather an advantage, in case the operators themselves intend to work them. Either in roasting or in pan-working, a small admixture of sand is unquestionably an aid. But if the sulphurets are being prepared for sale, they must of course be clean. In this case, the discharges from four machines can be conducted into a single additional one, and the concentration thus be made complete.

The proprietor has recently still further improved the machine, by the substitution of an iron frame for the former wooden one. While nothing is added to its weight by the change, it is thus made stronger and more compact; and at the same time the labor of setting it up is considerably lessened. He flatters himself that these added advantages leave nothing further to be desired as regards the perfecting of the machine.

References:

- Reference is made to the following mills, which have HENDY'S CONCENTRATORS in use:
- EMPIRE MILL.....Grass Valley, Nevada County.
  - ONEIDA MILL.....Jackson, Amador County.
  - SPRING HILL MILL.....Amador, Amador County.
  - GOLDEN GATE MILL.....Volcano, Amador County.
  - GOLDEN RULE MILL.....Stewart Flat, Placer County.
  - BENTON MILL.....Bear Valley, Mariposa County.

THIS COMPANY ARE NOW PREPARED TO FURNISH Sulphuric, Nitric and Muriatic Acids of superior quality, in quantities to suit. Orders will be received at the office on'y for Chemicals of every description, which will be manufactured as may be required. The Company beg to say that they have the advantages of all improved machinery and apparatus for the manufacture and manipulation of these products, and our Laboratory is fitted up with the most recent improvements which experience and science suggest, and is surpassed by none in completeness and perfection for the purposes it is designed. 9v14 3m

Foundry for Sale.  
A One-half Interest in the  
UNION IRON WORKS,  
SACRAMENTO,  
Owned by William R. Williams, is offered for sale on the most favorable terms.  
A Good Bargain  
May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 85 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets.  
Inquire at the office of the Foundry, or address  
WILLIAM R. WILLIAMS,  
25v13r9-16p Sacramento, Cal.  
ELECTROTYPING CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

### Lind's Improved Jonval Turbine.

We give annexed a side view and plan of Lind's improvement on the Jonval Turbine, which, through the agency connected with this office, was patented by Mr. A. Lind, of this city, in October last.

Fig. 1 is a vertical view of the wheel with a part of the stationary wheel removed, showing the guide buckets, B, B; also a part of the rim of the running wheel, removed for the purpose of showing the buckets, A, A.

Fig. 2 is a plan of the wheel, with the upper part of the friction hall bearing, D,

removed, for the purpose of showing the friction balls as well as the frame-work. A, A, in Fig. 1, represents the buckets in the movable wheel; B, B, the guide buckets in the stationary wheel; C, the gate; D, the friction hall gearing, which supports the shaft and wheels. C, in Fig. 2, represents the gate; D, the lower part of the friction hall bearing.

The especial advantage which this wheel possesses over the ordinary Jonval, consists

in the fact that the rim enclosing the buckets, A, A, is attached to the buckets, and revolves with them by means of the lip joint shown at the connection with the rim enclosing the guides, B, B. By thus making the rim to revolve with the buckets, the friction of the water against the inner side of the rim in the original Jonval is entirely removed; while the great danger of hend-

ing the buckets in the old wheel, by sticks or gravel passing through, is entirely avoided. In this present wheel, whenever any considerable quantity of debris finds its way into the wheel, it merely has a tendency to reduce the power by filling the water space, without damage to the wheel; which may at any time be stopped and cleaned out. The revolving rim also greatly reduces the leakage; in fact, it is impossible for any leak whatever to occur, except through the lip joint, which, when properly constructed, is almost water-tight.

There is an arrangement of stoppers attached, but not shown in the illustration, by which the apertures of the wheel may be readily closed or opened for the purpose of using more or less water, and by which the same percentages of power may be obtained from the water whether the flow be more or less. Parties who have used this wheel speak highly of its efficiency. For further particulars, address A. Lind, at the Pacific Foundry, in this city.

**THE RUSSO-AMERICAN TELEGRAPH.**—The managers of this enterprise, the extension of which across Behring's Straits has been abandoned, have proposed to complete and put it in working order as far as Sitka, provided the Government will grant an annual subsidy of \$20,000, for which the company will transmit all Government and all purely scientific messages free. It is to be hoped, for the interest of the Pacific coast and the future prosperity of our new northwestern possessions, that Government may be induced to consider this proposition favorably. The attainment of rapid and constant communication with that distant territory must be of great importance to both the Government and the trade which must soon spring up there under the new Anglo-Saxon rule. If that territory is worth purchasing at the price paid, it is certainly worth "hitching on" to the balance of the confederacy, especially when it can be effectually done at so slight a cost and with such a slender thread of communication. Let us, by all means, have a telegraph to Alaska.

**NEW CORN EXCHANGE.**—Owing to an unfortunate difficulty among the produce dealers as to the proper location for such an institution, the project of the establishment of a Corn Exchange for this city has hsen, for the present, postponed. One portion of those interested were desirous of holding the meetings in the public rotunda of the new Exchange; another portion was equally as desirous of selecting some locality nearer to the city front, somewhere in the vicinity of Clay and Davis streets, as more central and convenient for the majority of the produce dealers. It is greatly to be regretted that such a trifling matter should be allowed to prevent the establishment of an undertaking so essential to a rapidly-growing and most important branch of the commercial industry of this city. As it is, produce transactions generally, and especially in wheat—which latter alone, during the past year, have exceeded in amount ten millions of dollars in gold—are confined almost exclusively to the country, to the great detriment of dealers in this city.

**SUBMARINE MOUNTAINS OFF THE COAST OF CALIFORNIA.**—The *Bulletin* of Monday last gives some interesting facts with regard to the project of a submarine telegraph between this port and Japan and China, via the Sandwich Islands. It appears that a very extensive series of soundings was taken, with reference to such a project, some ten years ago, by Lieut. Brooks, of the U. S. Coast Survsy. In the course of these soundings the interesting fact was developed that about three hundred miles west of the Golden Gate, and parallel with the Coast Rangs and Sierra, there exists a range of submarins mountains, with an average depth on their summit of about two miles. This range is supposed to run parallel with the coast, and appears to be as distinctly defined as the two ranges upon the land. Beyond this submarine mountain the ocean presents a nearly level plateau to within a short distance of the Sandwich Islands. Lieut. Brooks says there would be less difficulty in laying a cable from San Francisco to the Islands than there was in laying one from Ireland to Newfoundland. The time will undoubtedly come when this project, which seems so chimerical now, will be an accomplished fact, demanded by the great commercial interest between the two continents, the future importance of which is already looming up with no insignificant proportions.

**PETROLEUM FUEL.**—In the process of burning petroleum for steam fuel, a small quantity of the surplus steam, after passing through a superheater, is introduced at the same time with the oil, and is found to add greatly to the intensity and volume of the flame. It is claimed that this steam is introduced in a semi-decomposed state—that is, with the affinity between the oxygen and hydrogen, of which it is composed, so weakened, that when introduced directly within the flame of the oil it burns rapidly, without any appreciable extraction of heat from that produced by the burning oil. In fact, when so presented, the re-union of the oxygen and hydrogen is so rapid that a great increase of heat is produced in the flame. The superheating is accomplished by waste heat, or heat which could not otherwise be brought to bear upon the water surfaces of the boiler. The problem of burning water, which has heretofore been pronounced an absurdity, so far as any practical advantage to be derived therefrom may be concerned, appears to be, by this device, pretty effectually and satisfactorily accomplished. At all events, there is an evident increase of steam production over and above that employed under the furnace by this use of steam. The fact appears to be patent, and scientists will evidently have to admit and explain it.

The aggregate production of gold in the world for eighteen years past, is \$3,341,500,000, of which the Pacific States and Territories yielded nearly one-third, while Australia and New Zealand produced nearly one-fourth.

**BELLES-LETTRES**, by Augustus Layres, Professor of various Languages, Rhetoric, and Sciences. San Francisco: A. Roman & Co.

This volume comprises the second of a series on composition, Belles Lettres and Oratory, which are now in process of preparation by Prof. Layres. The first of the series has already appeared, and been fully noticed in these columns. The present volume forms an "Introduction to the Study of Belles Lettres," the design of which is to facilitate the art, and abridge the study of composition. The method pursued is both synthetical and analytical; the former for teaching the rules, and the latter the practice of composition.

The work embraces some new and important features, and is the result of many years of study and practice, as a teacher. We have not yet had an opportunity to make a critical examination of the work, but shall endeavor to do so at an early day. In the meantime, we can safely recommend it on the well known reputation of the author, and hope to see it generally introduced into our schools and seminaries of learning.

**THE LONG ROOM** is the designation given to one of the rooms in the new Exchange Building, which will hereafter be occupied as an Open Board, under the direction of Mr. T. C. Sanborn, who will be assisted by Mr. Ralph C. Dorr, as Secretary. The room is pleasantly located, just to the right of the main entrance of the building, and was first opened for business on Thursday. It is neatly and appropriately furnished, and in every way convenient for the purpose designated. Nearly 300 persons have already enrolled their names as subscribers. The institution could not have been entrusted to better or more experienced hands. Any person can become a member by enrolling his name and paying \$10 per month.

**NITRO-GLYCERINE.**—It is said that a company has been formed for the manufacture of nitro-glycerine in this city.

**NEWSPAPERS.**—There are now about 4,000 newspapers published in the United States and Territories.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

(Written for the Mining and Scientific Press.)

## The Reese River Country and its Mines.

BY A. J. HOWK.

(Concluded from Page 34.)

## EMPIRE DISTRICT

Adjoins Hot Creek on the south. The first discoveries were made here by Joseph Saborn and party in July, 1866. The principal mines on which any considerable work has been done lie six miles south of the Gazelle mine, mentioned before. They are confined to one mountain, which is a continuation of the same belt of lime-capped slate and porphyry.

The Oakland and Liberty lodes are so far remarkable for the large quantity of rich ore, especially the former, which yields exceedingly rich pure ore (horn silver), much of it assaying \$1,000 per ton; however it must not be understood that such would be the working yield of the lode. These lodes, together with five or six others, comprising all the outcrops exposed in this belt, are the property of the discoverers, Messrs. Saborn, Sine & Co., who have been for many months vigorously engaged in their development. They have recently hauled a quantity of the ore to the mill at San Antonio, forty miles southwest of Empire. This district has a close resemblance in all features to Hot Creek District; the same vast quartzite dike, two or three hundred feet wide, running north and south with the range, separates the two mineral-producing belts. Here, as well as at the latter named place, we find the lodes on the east of this dike very numerous and well defined, but, as a general thing, not of the astonishing richness that characterizes those of the western belt. The district is well provided with fuel, especially in the center of the range, which rises abruptly from the Shoshone Valley on the west and descends more gradually to the great valley lying on the east.

## MILK SPRINGS DISTRICT

Adjoins Empire south. This was first discovered in August last, but was reorganized in January or February of the present year, consequently but little has been done towards its permanent development. In all surface characteristics it is similar to the last mentioned. Being situated out of the line of travel by any of the natural or graded roads, it has not heretofore received the same attention. It is probable that a branch of Clark & Co's road, diverging southerly from Egal Pass, will be constructed through Empire and this District, making a direct line to Reveille. This will be a necessity for the accommodation of the country between the great natural pass of the Diamond Range (Hot Creek Cañon) and this district, within which boundaries there probably exists a greater surface display of silver than can be found in an equal section of any mountain range of Eastern Nevada. At no distant day their permanency will be determined; and should they prove to be true fissure veins, of which there can be no reasonable doubt, the districts of Hot Creek, Empire and Milk Springs will stand unrivalled among the silver-producing districts of the world.

## REVEILLE DISTRICT

Is situated in a short, broken range of mountains, about due east of Milk Springs, near twenty miles distant. It is forty miles southeast from the eastern entrance of Hot Creek Cañon, and probably sixty west of Pahranaagat. It was discovered early in 1866, and a moderate amount of work has been continued ever since. This astonishingly rich district has been more fortunate than its neighbors in receiving the notice of the press, and is consequently better known abroad. For the production of surface ore of the most fabulous richness, it is perhaps

ahead of all others. A large quantity of this ore has been hauled to Austin for reduction, a distance of 145 miles, the reported yield from which has ranged from \$300 to \$800 per ton, while closely assorted lots have reached a much higher yield. Assays of \$5,000 and upwards per ton are not infrequent; in fact, such can be obtained from numerous lodes, nor is the quantity of such ore by any means limited. Much has been said about these rich deposits being mere "bunches," but recent developments tend to disprove this idea and establish them as true fissure veins, distorted by the crust of limestone, which is undoubtedly only superficial. The Fisherman lode has been opened to the depth of forty feet, showing, if they are bunches, that they are at least extensive ones; but the idea that these rich deposits of ore are scattered over the surface at random throughout this region, is an absurdity. The fountain-head lies below, and if any marked change occurs, it will be to prove that the deposits in sight are mere bagatelles compared with those below. A mill of five stamps will soon be in operation here in connection with the mines of the Rutland and Reese River Company. This district, as stated above, is not in any of the continuous ranges, being situated in a detached cluster of comparatively low mountains, midway of the great valley lying between the southern extremities of the Diamond and White Pine ranges. The last two ranges, like all the others of the central and eastern part of the State, lose their uniformity and regularity at this latitude south, the whole blending in chaos of valley, mountain, moraines and desert, as intricate in their windings here as they are uniform further north.

To the south lies a vast and almost unexplored region—an extensive field for the ever-restless prospector for the repetition of what his class has accomplished during the past year in this section. As this useful but poorly paid portion of our population push their explorations further into the unknown depths of the Great Basin, most of the former terror report has attached to it will vanish. Already a large portion of this region has been found to be not only inhabitable, but a desirable place of residence. Permanent homes will be made there, ranches, gardens and orchards will blossom along the water-courses in the sheltered glens of the foothills; silver discoveries that stagger belief will continue, and he turned over to the more fortunate that come after, until the poor prospector has exhausted the field and finds himself without employment—alas! too often in poverty.

(Written for the Mining and Scientific Press.)

## Oil Search in Humboldt County.

EUREKA, July 10th, 1867.

MESSRS. EDITORS:—Last week I visited a portion of this county in which search has been made for petroleum. Work has been suspended on most of the wells. Two companies, however, are disposed to make more thorough prospect before abandoning their claims. These will be considered tests of the oil-producing capacity of our county, and if successful, most of the other claims will be revived and work resumed. This is very desirable, for there is no better lubricator of the wheels of commerce than a flowing well of petroleum.

On Bear river, the Davis Company are still at work, under the superintendence of Mr. Hunter, a gentleman of long experience in this business. They use a portable steam engine, and have attained a depth of 626 feet. Progress last week was hindered by what is called swelling of the well. Mr. Hunter is quite sanguine of being able to give the company a deep hole—not so sanguine of getting oil. The company aim to go at least 1,000 feet, and at present rates this may be attained this season.

The Union Mattole Company's well is down about 600 feet. Oil was first obtained at a depth of 390 feet, and the well would yield to pumping about thirty gallons per day. Not satisfied with this yield, the company resolved to go deeper. They have been troubled by slight caves from that portion in which oil was found, and have been obliged to pipe about 550 feet. They are now ready to push on the work with greater facility. Their motto is, "More oil, or a hole 1,000 feet deep."

My opportunities for research were limited to these two localities. I am not prepared, of my own knowledge, to give any opinion as to the value of these petroleum claims. I am assured that there are much better surface indications at points where little has been done by way of prospecting.

## Facts About Patent Matters.

NUMBER SEVEN.

In my last I illustrated some of the numerous bad practices that exist in connection with the patent business, as at present conducted. It may be that some of my readers have about made up their minds, in view of the facts stated, to have nothing more to do with patents or patent agents; but that would be wrong. There is no business or profession that does not have its bad agents or members; and none in which there is not more or less of fraud and dishonesty. It is true, that sometimes when viewing theascalities of some of these geenty, I am ready not only to agree with Pope, that "an honest man is the noblest work of God," but inclined to think the sentence would be rendered more suited to the times, by adding—and the scarcest! Still, I would not be understood as saying that patent agents are "sinners above all other men," for they are not. On the contrary, they are probably about as honest as the times, and the nature of the business in the present condition of society, will admit of their being! As a large proportion of them are lawyers, or were educated for that profession, we should not expect too much of them in this respect. It is an old saying, that the man who goes to Heaven from New Orleans, is entitled to more credit than he who goes from New England, on the principle that the greater the temptation, the greater credit in resisting it, and therefore, when we do find one that is honest, we should prize him all the more. I am glad to be able to state that there are some such,—men who are above the "tricks of the trade" as practiced by the smaller fry, and who are an honor to their profession. Would that their number were greater; and indeed, there is reason to hope that it may be—for, as the adage has it,

"The Almighty works a wonder now and then,  
And makes of lawyers honest men."

and as these are eventful times in which our clergy assure us, God is showing forth his mighty works, who knows but that we may have a special dispensation for the conversion of lawyers, sutlers, army contractors, and other hard cases? Surely it is a "consummation most devoutly to be wished."

Still, the reader will be very likely to inquire how it is that the patent laws are so framed as to encourage or permit the practices previously referred to. In reply I would say, that the laws were not so intended, and that it is not so much the fault of the laws as of those whose duty it is to administer them, but like all other laws, they are in general terms, making general provisions in relation to the subject, and leaving the management, the details, the application of the laws to be provided for by the executive officer, the head of the bureau. If now he happens to be a man, who, like most heads of bureaus, is appointed not because of his supposed claim upon the party or the amount of political influence that he can get to press his appointment—and who has no knowledge of patent or any other law—nor mechanical skill sufficient to enable him to comprehend the practical duties of the office, what then is to be done? Why, of course the public must suffer the consequences. Or worse still—if he be one of those who say,—Well now I am here for four years, and I am going to make the most I can, with the least trouble, and thence busies himself in appointing the members of his family, and his personal friends to positions in the bureau, for which they have no qualification, or to using his official position as a stepping-stone to a higher one in the future—then indeed must the public suffer. And such a spirit in the head of a bureau, is sure to be diffused more or less among the employes, who are too apt to feel that the responsibility does not rest upon them, and hence the bureau is sure to become more or less demoralized.

The practical application of the patent laws is provided for by a set of office rules, which have grown up during the existence of the office, having been added to, and altered, from time to time as circumstances and the changes in the case have rendered necessary. If these rules were strictly enforced most of the cases before alluded to would not occur. For instance, section 11 of the rules provides that "if an article is claimed as a mere improvement on another invention, that fact should be clearly stated; and if claimed as substantially differing from another invention with which it appears to be coincident, the difference must be clearly pointed out." And the latter clause of section 13 provides that, "if the specification is for an improvement, the original invention should be disclaimed, and the claim confined to the improvement." These rules were intended to meet such cases as I have instanced, and thus to prevent the frauds therein do-

scribed; and it is clear that if they were strictly enforced by all branches of the Patent Office, the greatest good would result therefrom. But unfortunately these rules are not enforced as they should be; and the ingenuity of designing parties and their agents has been applied to devising ways and means for avoiding them, until they have become almost a dead letter. When the honest inventor, or the honest agent applies for a patent upon an improvement upon such a device, patented so and so, and then claims only the improvement—as he should; and then the public is put upon its guard and knows exactly what it is buying, —to wit: the improvement simply upon another and prior patent, and thus all chance of fraud from that source is prevented. But the dishonest applicant or agent avoids this straightforward method of dealing, and while pretending to comply with the rule, evades it both in spirit and in letter. Instead of pointing out specifically what machine or patented device his is an improvement upon, or "stating clearly" that it is an improvement on another invention, he simply says that he has invented a new and improved device—naming the general class to which it belongs, as for instance a seeding machine, without even specifying whether it is a corn planter, a grain drill, or a cotton or potatoe planter. And then, instead of "disclaiming the original invention," he makes a claim that shall embrace with the improvement, all the features of the original!

The reason why these rules are not enforced are numerous, some of which have been already hinted at. There are also others. In most cases the papers are so drawn as to make a show of compliance, while in fact avoiding the application of the rule in its integrity, and at the same time is so worded as to render it difficult for the Examiner to insist upon any change. Again, the attempt upon their part to enforce such a rule brings them constantly in conflict with the applicants and their agents, and as they are not interested, they are very apt to conclude that there is no reason why they should insist, and thereby render themselves odious alike to applicants and agents; and more especially is this likely to be the case, if the head of the bureau never interests himself in the practical duties of the office, nor looks to see how his subordinates perform their duties. Another, and still greater reason is, that there are no settled rules for the guidance of newly appointed Examiners. Each one is placed at a desk without any instructions whatever, and left to find out what rules ought to govern his action, the best way he can; and as the old examiners generally seek to keep the new appointees from acquiring the requisite knowledge, lest they should become as well posted as themselves, and hence likely to displace them, it follows they are like others we read of, "in pursuit of knowledge under difficulties,"—and the result is that "each becomes a law unto himself," until, in the course of time, you can hardly find any two who will agree upon the various questions that are constantly arising in the practice of the office.

Again, while the head of a bureau knows but little of anything of the details of the business, and therefore is not likely to have suggested to his mind those reforms and improvements which are necessary to render the system complete in its operation; to receive such suggestions from one holding an inferior position—though perhaps greatly his superior in ability—would be undignified, and therefore not to be thought of for a moment.

There is a deal of truth in the statement recently made in the Tribune—that "brains are never recognized in clerks—only in heads of departments," and that being so, of course it cannot be expected that their suggestions, no matter how reasonable or important, should be adopted. In fact, as recently stated by the chief clerk of a bureau, they "don't want men of brains—for, if they have brains, they will be making suggestions, and therefore trouble!" With this condition of affairs existing in nearly all governmental departments, it certainly is not strange that "red tape" and "old fogyism" should rule the day.

The remedy for the diversity of action and ruling that exists among Examiners in the Patent Office is a unity of opinion and action to be secured by an interchange of ideas,—discussion of new points as they arise from time to time—and the adoption of such rules and reforms as the experience of those most intimately acquainted with the practical duties and operations of the office may suggest. All this, however, requires that the examiners shall be men who are qualified for their position—feel an interest in their duties, and attend to them—and more than all else, that you have at the head of affairs a man qualified for the discharge of the important duties devolving on him.—W. C. Dodge, in Prairie Farmer.

## Mechanical.

**CONSUME YOUR SMOKE.**—The economical and sanitary advantages derivable from the consumption of smoke is very properly attracting much attention in England, particularly in cities and other populous localities. It is surprising, considering the simplicity and cheapness of the arrangement by which the result is effected, that more attention is not paid to the consumption of smoke in this State. With the exception of the rope manufactory on the Potrero, the Spring Valley Water Works' pumping machinery, the Pacific Foundry, and the brewery on Jessie street, and possibly one or two other establishments, the mode of burning coal in this city and vicinity is slovenly and wasteful. The dense volumes of black smoke which are vomited forth from the smoke-stacks of the furnaces connected with most of our steam engines, fully attest the truth of the above. A more close examination is not needed.

It was recently stated by Mr. Hanbury, in the British House of Commons, as a fact within his own knowledge, that a manufacturing firm in Leicester, England, saved themselves \$10,000 a year in coal by burning it up completely and allowing none of it to be wasted in smoke; and that, at the same time, \$10,000 worth of coal was saved to the country. Very wisely the manufacturers of Leicester "have voluntarily made themselves subject to a law of their own" for the prevention of smoke by the better consumption of coal. The result is, that "in the very center of the town, flowers are found blooming as fresh as in a country village;" but that is not the only result. A steam engine at Leicester is worked more cheaply than in any smoke-begrimed town in the realm where such smoke-consuming appliances are not employed.

**INTERESTING TO IRON MEN.**—The Iron Masters' Laboratory, Philadelphia, propose to analyze all limestones which have been used as a flux in the blast furnaces throughout the States. Samples are asked for, so that the analysis may be made available to the iron interest throughout the country. It is earnestly requested that all iron work establishments and others, who may feel disposed to cooperate in this movement, will forward to the Iron Master's Laboratory, 339 Walnut street, Philadelphia, "about one ounce, in coarse powder, of a fair average of the stone found by use the best adapted to their purposes.

**ENGRAVING BY ELECTRICITY.**—Gaiiffe's electrical engraving machine, lately much improved, is in the Paris Exposition. Any number of plates may be engraved at once; the tool cuts them as in the ordinary lathe, and the rest is operated by means of a platinum point, which passes over the design made with a varnish. The point in passing over the varnish breaks the connection of the electric current, and thus demagnetizes an electro-magnet behind each graver, and allows a spring to press the graver against the plate on each machine: when the point touches the unvarnished part of metallic plate, containing the shades of the design, the electrical current is again established, and the electro-magnet draws back, by its attraction, the graver thus overcoming the force of the spring. It is easy to see how comparatively plain work, like maps, could be executed with this machine; but it is difficult to imagine how the depth of line in a delicate copper-plate is to be graduated by a graver governed by one pair of electro-magnets. The multiplication of copies in this plan is not as feasible to duplicate the original plate by means of the try-telescope process.

**NEW PROCESS FOR KEEPING NAILS FROM RUSTING.**—A Belgian has made a discovery which may be of some utility; it is that the rusting of nails employed to fasten the branches of fruit trees to walls, can be prevented, by driving into the wall, in contact with the nail, a small piece of zinc. In giving an account of his discovery to the Agricultural Society of Ghent, he exhibited nails which had been eight years in walls, in contact with a piece of zinc, and which were not at all rusty.

**THE MANUFACTURE OF ARTIFICIAL SHARPENING STONES.**—Artificial stones are manufactured in England to take the place of Turkey, Water of Ayr, and Arkansas stones, generally used in sharpening tools. They prepare with a compound which will admit of being molded to any required form, and which when molded may be hardened and brought to the consistency of stone. In carrying out the manufacture, the chips and dust obtained in preparing lithographic stones are reduced to fine granules, emery powder, borax and saltpetre are added and the whole thoroughly mixed in a mill. The mixture thus obtained is molded to any required shape—first submitted to hydraulic pressure, and then to furnace heat, whereby the hardness and consistency of stone is imparted to the molded articles. The following proportions will produce a good result, viz.: pounded lithographic stone twelve ounces, borax two ounces, saltpetre half an ounce, and very fine emery two ounces. Place these substances together in an ordinary incorporating mill with edge runners, the pan of the mill being heated by means of steam or gas, and subject the substances to the action of the mill until they are well mixed and incorporated. Then remove the compound thus formed and place it in strong iron molds for the purpose of being submitted to pressure. These molds are made of various shapes to suit the purposes for which the artificial stone is to be used.

The pressure necessary to effect a proper consolidation of the compound may be conveniently given by means of a strong hydraulic press. The amount of pressure which has proved satisfactory is about 20 tons per square inch of surface of the molded article. When the requisite mechanical consolidation of the compound has been produced, the molded article is subjected to a white heat in any suitable construction of furnace, or to such a heat as will serve to fuse the borax and saltpetre, and effect the binding together of the granules of stone and emery. The time required for attaining this object will, in general, be from half an hour to one hour. To prevent the warping and running of the molded compound under heat, it is clamped in molds made of plumbago, fire-clay, or other like heat-resisting material, before being placed in the furnace. When it is required to produce cutting or polishing wheels, hones, or other like articles with a less cutting power than those made from the before-named mixture, ordinary chalk is substituted for a portion of the lithographic stone granules. The proportions of the chalk and the granules should be half of each to produce a good result, the proportions of the other materials being retained.

**TO CEMENT BRASS ON GLASS.**—Puscher uses a cement particularly adapted for fastening brass on glass lamps, which consists in a resin soap—made by holling three parts of resin with one part of caustic soda and five parts of water—which is mixed with one-half its weight of plaster of paris. This cement has great adhesive power, and is not permeable by petroleum, it sets firmly in less than an hour, and is a very slow conductor of heat. Zinc white, white lead, or precipitated chalk may be substituted for plaster of paris, but the material will be longer in hardening.

**STEEL BOILERS** are now coming pretty largely into use on the locomotives of some French railways. Thus, twelve express engines on the Paris and Orleans railroad are thus furnished, as also several on that of Paris and Soaux, and on the Midi or Southern railroad fifteen eight-compound engines have steel boilers. The Orleans Company now employ cast steel plates for the circular smoke boxes of all their engines, new and old, steel being thus substituted for iron when repairs are made.

**HARD IRON.**—It is said that there is a malleable iron made by a Glasgow firm of such toughness and tenacity that the teeth of pinion wheels cast from it may be hammered down to the solid base without cracking. The process of the manufacture is kept a secret.

The widest span yet made in a timber bridge is believed to be that of the Schuylkill bridge at Philadelphia, the clear opening of which is 340 feet.

The salt formed in the boilers of a large steamer would, if not prevented by flowing off or surface condensation, amount to 20 tons per day.

Tin wire, the thirteenth of an inch in thickness, sustains 34-7 pounds; a lead wire but 28 pounds.

## Scientific Miscellany.

**A MESSAGE FROM THE STARS.**—Mr. Graham, Master of the Mint in London, has deciphered a message from the stars. It came to him as a piece of meteoric iron. When heated and tested with Sprengel's aspirator, this iron gave off three times its volume of hydrogen. And since malleable iron can be made to take up only about one-half its volume of hydrogen, Mr. Graham understood the message to be that the iron had come from a very dense atmosphere of hydrogen gas, such as would not be found within the limits of the solar system. Spectrum analysis has already shown that hydrogen is a prominent constituent in many of the stars, and Mr. Graham's experiment shows how it can be conveyed all these countless millions of miles to this earth.

**SENSITIVE FLAMES.**—We have previously noticed the experiments by Prof. Tyndall, of London, showing the manner in which gas flames are affected by sound. Mr. W. T. Barrett, lecturer on Physical Science, who early made extended observations in this direction, thus accounts for the phenomena: "A sensitive flame is one in which, on the slightest mechanical increase in the pressure, or, what here comes to the same thing, in the velocity of the gas as it issues from the burner, will change its shape and take very much the appearance it has when influenced by sound. Now the sonorous pulses excited by sound throw, among other things, the pipe which conveys the gas to the burner into vibration; the flow of gas is thereby driven from the sides and urged more towards the center of the tube; and the current thus confined within narrower limits must issue from the burner with increased velocity so long as the sound continues. It is the greater rapidity thus induced in the issuing stream of gas which causes the flame to shorten and diverge; lowering of the flame being an analogous effect to that noticed and explained by Dr. Thomas Young in his well known experiments on streams of smoke ascending into the air at different velocities." Several cases illustrating this action, and confirming his opinion, are described by Mr. Barrett in the April number of the *Philosophical Magazine*.

**A GOLDEN THOUGHT.**—We know not the author of the following; but it is one of the most beautiful productions we have ever read: "Nature will be reported. All things are engaged in writing their own history. The plant and pebbles go attended by their own shadow. The rock leaves its scratches on the mountain side, the river its channel in the soil, the animal leaves its bones in the stratum, the fern and the leaf the modest epitaph in the coal. The falling drop makes its sepulchre in the sand or stone; not a footprint in the snow or along the ground but prints in characters more or less lasting a map of its march; every act of man inscribes itself on the memories of its fellows and his own face. The air is full of sound, the sky of tokens; the ground is all memoranda and tokens, and every object is covered over with hints which speak to the intelligent."

**A UNIVERSAL TELEGRAPH.**—Prof. Hitchcock has a chapter upon the "Telegraph System of the Universe," in which he broaches the remarkable theory that "our words, our actions, even our thoughts, made an indelible impression upon the universe." This proposition he endeavors to sustain by an appeal to well established principles of science. He shows by the doctrine of mechanical reaction that every impression which man makes by his words or his movements upon the air, the waters, or the solid earth, will produce a series of changes in each of those changes which will never end. Not a word has ever escaped from mortal lips, he contends, but it is registered indelibly upon the atmosphere we breathe. And could man command the mathematics of superior minds, every particle of air thus set in motion could be traced through all its changes with as much precision as the astronomer can point out the path of the heavenly bodies. In like manner the pictures of every occurrence propagate themselves through the reaction of light on the substances on which it impinges.

BORAX has been crystallized by Wohler & Deville, in their laboratory, with a brilliancy almost equal to the diamond, and of an exceeding hardness.

**GEOLOGY OF THE METALS.**—The metals were doubtless dissolved in the waters of the primeval sea at its formation, and in great part precipitated in its early sediments, to be again dissolved by infiltrating waters and brought to the earth's surface. From their soluble oxidized condition they have been reduced by organic matters, sometimes to the metallic state, as in the case of the copper of Lake Superior, but more generally to the condition of sulphurets. Whenever decaying organic matters encounter sulphates which abound in sea water, they give rise to sulphides or sulphureted hydrogen, which is nature's great agent for precipitating metals and removing them from the terrestrial circulation. Hence we find, in various rocks, sulphurets of iron, copper, zinc and other metals, sometimes in considerable proportion, forming workable beds of ore, but more generally sparingly disseminated. Nature's way of concentrating these sparsely shattered metallic matters is to dissolve them out by certain mineral waters, generally when the waters are deeply buried; these waters ascending through joints or fissures in the rocks, and gradually becoming cooled or changed, deposit upon the walls of these then dissolved matters in the shape of ores, often mixed with spars and other minerals which constitute the veins. Experiments show that alkaline bicarbonates and sulphides which abound in the hot mineral waters are the proper solvents for the dissolved metals, and this process of concentrating the metals in veins is doubtless now going on in portions of the earth's crust.

**UNINFLAMMABLE STUFFS.**—It appears from the experiments made by French chemists that only three salts have as yet been found that may be successfully applied to the manufacture of unflammable fabrics for ladies' dresses. There are many other salts that would do the same, but not without spoiling the dye or gloss or texture of the stuff. Of the three in question, the sulphate and the phosphate of ammonia have the inconvenience of being decomposed by the heat of a smoothing iron, but are applicable in those manufactures where stuffs are stiffened by the action of hot air, or cylinders heated by steam. They exercise no action upon either the thread or the color of the stuff. The phosphate of ammonia may be mixed with half its weight of hydrochloric of ammonia. To obtain an efficacious solution, twenty per cent. of this mixture must be dissolved in water. A solution of seven per cent. of ammonia produces the same effect, and is therefore the most economical salt that can be employed. But in those cases in which the smoothing-iron cannot be dispensed with, as in linen, for instance, a solution of twenty per cent. of tungstate is preferable. To obtain the desired effect, all these solutions must be applied to the stuffs after they have been stiffened and dried, because starch is always used in a weaker solution than that required for these salts. Acid tungstates destroy the thread of cotton stuffs, like borax, alum, etc.

**SPECIFIC HEAT OF SOILS.**—Pfraunder, in his investigations concerning the specific heat of soils, during which he determined that of seventeen different soils he has noticed that soils free from humus have the lowest specific heat, whether they consist of lime or of sand. The richer a soil in humus, the higher is the specific heat. Thus peat was found to have 0.507, and a soil very rich in humus gave 0.4142, while that of calcite and quartz is only 20 and 19. Loamy soils must have a high specific heat, owing to the presence of water. These facts are important to the agriculturist, since a plant sensitive to the changes of temperature would not grow well on soils of low specific heat.

**COLORS FROM PROTEIN COMPOUNDS.**—Erdmann observed that some roast veal was superficially red; he transferred a portion of the red matter to other substances, and found that with moisture and a proper temperature the coloring matter increased. It is probably produced by infusoria in the same sense as alcohol is made by yeast. Researches on blue milk by several German chemists show results closely analogous to those made by Erdmann.

SOUND is always propagated outward in a straight line, but recoils like a ball when driven against any obstacle, which, by its dimensions, is sufficient to intercept the undulations. It is to this rebound that we owe the beautiful effect of echoes.

Golden Rule Mining Company.

The following is the report of the Board of Trustees of the Golden Rule mining company, of Tuolumne county, for the yearly statement from July 1, 1866 to July 1, 1867:

Table with columns: Month, Amount Ore Crushed, Days Run, Average Per Ton, Value. Rows for 1866 (July-December) and 1867 (January-June).

Product, 2,155 ounces of retorted bullion, averaging about \$17.05 per ounce—fineness, gold, .875 to .881.

The above ore has been crushed and returns made from fifteen 700-pound stamps, water power, which is run by a 50-foot overshot wheel. Eight miners are employed regularly, and two carmen, four millmen, one blacksmith, and one superintendent—making a total of sixteen men, at a cost of

Table listing labor and expenses for the past year, including mill repairs, timber, charcoal, hauling, taxes, etc., and expenses for supplies sent from San Francisco.

Total expenses of the company per ton of ore crushed during the year, \$6.39; average value of ore crushed, \$8.94 1-5; net profit per ton, \$2.55 1-5.

Our mine at present is in good working order. The vein is open on the tunnel level about 400 feet, at a width of six to eight feet, eighty feet below the surface, from which our tunnel takes the surface drainage water. For the past six months we have been working on a level forty-four feet below our tunnel level, carrying a vein of from seven to eight feet in talcose slate, containing small stratas or threads of quartz. To what depth we may be able to carry it and find good pay ore, remains to be seen. Geologists and scientific millmen say that this vein matter is from a fissure of the Mother Lode, below which it is running parallel with our lode, and west of it, at our present depth of about forty feet. On the whole, prospects look encouraging for another year's work on the mine.

As to the mill, we are able to crush fifteen tons per day, through a No. 40 to 50 brass wire screen, and amalgamating 8-10 of all the gold in the batteries, saving 1-10 from copper plates outside, on our aprons, and 1-10 from our blanket washings, ground each day in a stone arastra. We find the best drop for our stamp is set at five inches, and not to exceed eight—running at a regular speed of fifty-strokes per minute.

The present officers of the company, are: Superintendent at the mine, A. J. Pfeiffer; Trustees: R. L. Pasteur, J. H. Turney, J. T. Boyd, E. V. Hathaway; and President, W. Bosworth; Secretary, J. B. Russell.

W. BOSWORTH.

AMERICAN RELICS IN GREECE.—There is a gentleman now visiting all the celebrated battle-fields of the late war, under a commission from the late King of Greece, to collect therefrom suitable memorials and records, for preservation in the royal archives of Athens. The story of Xenophon has found a parallel in the march of Sherman. Where is the loyal American heart that does not thrill with patriotic emotion when reflecting that the descendants of those who died at Marathon are now seeking to study and honor the grand struggle for American freedom. There is truly a fitting and a graceful compliment in thus twining the great deeds of American heroism with the memorable traditions of Hellenic story.

GOLD MINING is about to be commenced at Bluffton and Huntington, Indiana. At the latter place, a quartz mill is being erected at a cost of \$10,000.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

RECENT INVENTIONS.

IMPROVEMENT IN NAUTICAL INSTRUMENTS. Mr. George Davidson, who left this port, on Sunday last, in charge of the scientific expedition to the late Russian Possessions, has recently devised an important improvement in telescopes for sextants, quadrants, etc., by which an artificial horizon for observations can always be had when the nautical horizon is undefined or obscured. The invention consists of the application of a small spirit level on top of the usual telescope, the bubble of the former, by the use of a prism, being reflected in the latter. The telescope has a fine wire horizontal line drawn inside, which, being made to bisect the image of the bubble, a true artificial horizon is obtained. This invention has been found very useful in land service for taking observations in surveying, and is considered particularly valuable for sea service, where accurate nautical horizons are required, but are frequently not to be obtained. The improvement has been sent to the World's Fair at Paris for exhibition.

USEFUL INVENTION.—The Dutch Flat Enquirer speaks of a newly-invented machine which is likely to create a complete revolution in hydraulic mining, as it is claimed by the inventor to supersede the hose method of conducting the water. The machine is attached directly to the pipe, and by it the stream of water is easily directed in any required direction. The North American Company at Michigan Bluff are now using the machine and are said to be greatly pleased with it. It is said to be cheap and easily managed. No description of the invention has been given.

THE AMERICAN DISHWASHER.—A machine for washing dishes has been invented and tried at Syracuse, with satisfactory results. It is thus described: "It is in shape like a wash tub with legs, and provided with a cover, to which is attached the machinery for working it. Around the inside a wire frame is constructed, between which and the sides of the machine dishes are placed, overlapping each other. After filling the space provided with dishes, a quantity of hoiling water is poured in the center of the machine, which is provided with a screw-shaped paddle, operated by a cog-wheel, which is adjusted on closing the cover. By turning the crank a few seconds, the boiling water is forced between and about the dishes with sufficient force to remove all grease, etc., which may be upon them. The machine is arranged so that the water can be drawn off beneath, fresh water introduced, and a few turns of the crank thoroughly rinses the dishes, and it only remains to take them out and stand them on their edges to drain. No wiping is necessary, the dishes having attained a temperature sufficiently hot to dry them perfectly.

A NEW SYSTEM OF WORKING OARS.—Mr. E. D. Farcot, of Neuilly, France, has devised a plan for working oars, quite novel, and said to be eminently practical. The oars are not worked in row-locks, but from a short stanchion or mast springing from the bottom of the boat. The rower sits with his face to the bow, instead of to the stern, so that he can see where he is going. He does not take hold of the oars at all; they are secured to the upright mentioned by springs, eyes and pintals, in such a manner that they may be operated by hauls, grasped like the handle of the common short-handled shovel or spade. Both oars can be worked by one hand when desired. The total weight of the apparatus for a pair of oars, including the oars themselves, need not exceed fifteen pounds.

A TYPE-WRITING MACHINE.—A machine has been invented by a Mr. Pratt, of Alabama, by which, it is assumed, a man can print his thoughts twice as fast as he can write them, and with the legibility of a printed page. The alphabet, with figures, etc., is formed in a solid stereotype plate, with the bodies of all the letters uniform in size. He prints a letter by the blow of a minute hammer, of size uniform with the size of the type body—striking the face of the letter, with a sheet of carbonized paper and that on which he would print intervening. Each letter, as wanted, is moved into position under the hammer by compound levers, actuated by keys, like those of a piano. The subject of type writing is an interesting one, and may be one of the accomplishments of the future; but it is hardly a thing that can spring fully developed into existence at one effort.

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board. SAN FRANCISCO, SATURDAY MORNING, July 27, 1867.

We present in the annexed table a very flattering exhibit of the present condition of our savings and loan institutions:

Table titled 'Semi-Annual Reports of the San Francisco Savings and Loan Societies.' Columns include Name, Date of Report, Deposits, Loans, Grace Dividends, Reserve Funds, Expenses and Interest, and Cash on Hand. Lists various societies like Hilberna, Savings and Loan Society, etc.

It will be observed that the deposits in the several institutions have been augmented \$3,474,370 71 during the first half of the present year, \$5,073,094 69 within the space of one year, and nearly doubled since January, 1866—a period of eighteen months. We have not ascertained the number of deposit accounts at the date of the last semi-annual reports, but taking the statement we made twelve months ago in the Weekly Stock Circular as a basis, we may arrive at a very near approximation. At that time the depositors numbered 13,000 in round numbers, and adding the same ratio of increase as shown by the deposits, which is seventy per cent., we obtain the large number of 21,000 depositors, giving an average amount of nearly \$560 to each account. Estimating the population of San Francisco at 120,000, these savings would give to each inhabitant \$115.

Mining Share Market.

The mining share market continues to attract marked attention, a disposition to invest manifesting itself in a more general degree than has been the case for a long time past, and especially among those of comparatively limited means. The recent material decline, and the fluctuating rates at which shares rule at present, stimulate a desire to venture in order to realize small gains within a brief period, and for this purpose buyers' optional purchases are freely made with the hope of a general advance shortly over present rates, which opinion appears to be well founded. The recession in most shares up to Wednesday has been very considerable, since which time the market has become firmer, and at the close most stocks sell at enhanced rates.

SAVAGE—Sold at fluctuating rates, receding from \$4,500 to \$4,000, rallying to \$4,150, and at the close selling at \$4,200. During the week ending July 20th, this mine yielded 2,210 tons of ore, the approximate value of which is stated to be \$96,394, or an average of \$43 61 per ton. As compared with the previous week these figures show an increased yield as well as an improvement in the ore. The north mine, on the seventh level, continues to yield the largest quantity of ore, having contributed over half of the above amount, while the middle and south mines on the same level, with the exception of 147 tons from the third station, produced the remainder. In the absence of the Superintendent no detailed weekly statement, as usual, reached the office in this city. A special meeting of the stockholders is called by the Trustees, to be held next Tuesday, the 30th instant, for the purpose of increasing the capital stock to \$3,500,000, and dividing the same into 16,000 shares of \$200 each. This will doubtless be done, thereby enabling those of limited means to invest in the largest producing claim known.

HALE & NORCROSS—Continues to be firmly held; no sales transpired during the week. We quote it at \$3,200 asked. The average value of the company's ore is much better this month than last. On the 22d instant the shaft was 558 feet in depth.

CROWN POINT—Has been actively dealt in at extremely variable rates, opening at \$1,225, rapidly rising to

\$1,590, falling to \$1,260, and closing at \$1,330. The "strike" in the east drift from the 600-foot station, which had such a marked effect on the stock early in the week, was found to be about thirty inches in width; however, they are drifting in close quartz and porphyry, with some spots of ore, on the east of it, and on the west of the ore they passed through about five inches of dark clay. On the 500-foot level, 21 feet to the west, the same clay seam was penetrated. From the Superintendent's weekly report, dated July 19th, we obtain the following: Ore delivered to custom mills, 589 1/4 tons, showing an approximate value of \$20,223 34; extracted from the mine in the same period, 584 1/4 tons, the 65 1/2 cent. average assay giving \$34 39 to the ton. The ledge on the east vein had been opened 121 feet; the cross-cut east from the 600-foot level had been carried forward 2 1/2 feet; the winze from same level was 82 feet in depth, and the east drift on the 600-foot level was in 105 feet. Advances to the 24th instant state that the average 65 per cent. assays for the past three days have been \$30 80 of ore obtained from the 400-foot level, and \$46 11 of ore taken from the 600-foot level.

YELLOW JACKET—Has been in the market to a considerable extent, declining from \$900 to \$750, rallying to \$900, and closing yesterday at \$905. The information from this mine is more encouraging than has been the case for some time past. The usual annual statement made in July has not yet made its appearance. It would be a great convenience as well as benefit to all concerned if the office of this company was located in this city.

GOULD & CURRY—Has also declined very materially since our last reference, receding from \$760 to \$625 per foot, then selling at \$650@675, and closing yesterday at \$710. This mine shows no material change. The drifts continue to look promising, but a month may elapse before different ground will be reached.

CHOLLAR-POTOSI—Declined from \$455 to \$402 50, advanced to \$435, and at the close realized \$435. The various portions of this claim yield as follows: Blue Wing level, about 50 tons of ore per day, which it is reported will mill \$28 to the ton; Plute station, from 13 to 20 tons per day, averaging \$30 per ton; New Santa Fé level, some 20 tons, at \$27 per ton; and from the Old Santa Fé level, about 120 tons are daily extracted, showing an average yield of \$27 per ton. The ore is said to lock well between the third Santa Fé and the Old Santa Fé levels, and is reported to be 130 feet in length and 31 feet wide, producing about 180 tons of ore per day, which will yield from \$24 to \$30 to the ton. In the new shaft sinking is favorable. The station timbers for the 611-foot level are completed, but it is proposed to drop down another hundred feet before drifting off. During the week ending July 18th, 2,318 tons of ore were sent to custom mills; previous week, 2,185 1/2 tons.

KENTUCK—Opened at \$415, gradually declined to \$360, improved to \$400, and closed at \$395. The hullion returns from July 1st to the 23d, inclusive, amount to \$65,877 43, against \$68,569 37 same date last month. The largest proportion of the ore came from the upper works, which is of a lower grade than that obtained from the lower level. The receipts of the present month, it is thought, will not fall short of the returns made in June. This company has been hoisting from 70 to 80 tons of ore per day, during the past two weeks, for the Yellow Jacket Company.

EMPIRE—Has been in better favor this week, advancing from \$195 to \$215, then selling at \$210@200, and closing yesterday at \$204. The report upon this property recently submitted by Mr. Brown, the President of this company, makes favorable mention of the present condition of both the mines and mills, and is encouraging as to the developments in the future. The management, both here and in Nevada, is in excellent hands. The supply of ore is reported to be ample until such time as the drifts from the new shaft will be carried to the lode.

OVERMAN—Has been in decided favor during the period under review, opening at \$165, improving to \$180, receding to \$167 50, advancing to \$240, and closing at \$220. The general appearance of the mine is very promising, and the developments on the several levels are very favorable. On the 300-foot level a large body of ore has been found, and the discoveries on the 226-foot level produce average assays of \$40@45 to the ton. Since our last issue over \$100,000 in hullion has been received, and since the first of June the hullion returns amounted to \$42,058 16.

OPHI—Has been in less favor, rapidly declining from \$240 to \$140, rallying to \$155, and closing yesterday at \$152. Ore continues to be obtained in small quantities, but of good quality. A cross-cut in the north drift, 210 feet north of the main east drift, has already developed fifteen feet of the vein without reaching the west wall. An assessment of \$3 per share, or \$36 per foot, is anticipated during the coming week.

BECKER—Advanced from \$310 to \$350, declined to \$260, rallied to \$300, and at the close sold at \$315. EMPRE continues in the market at the closing price of last week—\$180. GOLD HILL QUARTZ sold at \$185@175. A dividend of \$15 per share is confidently expected next month.

CONFIDENCE—Ruled at \$62 50@55, and BULLION at \$35@26, closing at \$25. An assessment of \$15 per share was levied on the latter stock on the 17th instant. DANEY sold at \$19@25; JUSTIS ANN INDEPENDENT at \$15 @10; SEGREGATED BELCHER at \$10@12, closing at \$8.

SIERRA NEVADA—Advanced from \$16 to \$25, closing yesterday at \$18. This rise is based upon the prospects of soon ascertaining the existence of a ledge by draining the mine, the machinery for this purpose being nearly ready.

NEW INCORPORATIONS.—Articles of incorporation have recently been filed in this city as follows: CUMBERLAND M. & M. Co.—Storey county, Nev. July 23d. Capital stock, \$100,000; 1,000 shares, \$100 each. Trustees: A. T. Page, Henry Christie and Alfred Bryant.

SAN FRANCISCO WATER CO.—San Francisco. July 24th. Capital stock, \$6,000,000; 60,000 shares, \$100 each. Trustees: James T. Boyd, Milo Hoadley and John H. Turney.

ELECTION OF OFFICERS.—GOLD HILL T., G. & S. M. Co.—July 20th. Trustees: Camila Martin, P. G. Venard, O. Gori, F. O. Wegener, H. Motz, H. Huguet and R. Wegener. President, Camila Martin; Secretary and Treasurer, R. Wegener; Superintendent, H. Huguet.

Fluctuations in Leading Mining Shares for the past Six Months.

Table with columns for Name of Company, Jan. 10th, Jan. 21st, Jan. 30th, Feb. 9th, Feb. 20th, Feb. 28th, March 9th, March 20th, March 30th, April 10th, April 20th, April 30th, May 10th, May 20th, May 30th, June 10th, June 20th, June 29th.

PROFITS OF COÖPERATIVE LABOR.—There is a coöperative association in Troy, N. Y., composed of forty-eight iron founders, who have a capital of \$25,000, in shares of \$100 each—every member a laborer.

CHURCH ORGAN FOR THE SANDWICH ISLANDS.—Among the evidences of progress at the Sandwich Islands, we notice the fact that a fine church organ has just been completed at Boston for a native church edifice at Honolulu.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Table with columns for Name, Location, Amount, and Day. Lists various mining companies and their shareholders.

San Francisco Market Rates.

Table with columns for Commodity and Price. Includes Flour, Wheat, Corn, Rice, Sugar, and various oils.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

Table listing various books with authors and prices. Includes 'ANSTED'S Gold Seekers Manual', 'ANTISELL', 'BLAKE, W. P.', etc.

A PAPER FOR BEECHER.—There is considerable talk of starting a new religious newspaper in New York, to be under the editorial management of Mr. Beecher.

YEDDO, a city of two million inhabitants, has no beggars.

METALLURGIST.—A practical metallurgist, experienced in all branches of his business, and particularly in the manufacture of rosen correa, wants employment.

DEWEY & CO. PATENT AGENTS, ENGRAVERS AND PUBLISHERS. Mining & Scientific Press. SAN FRANCISCO.

Important Notice.

Another New Doctor in the Field!

DR. H. A. BENTON, Has been performing many wonderful cures in this city the past two years, and, as his practice is fast increasing at the office, he finds it difficult to attend all the outside calls, and has concluded to invite B. H. OLMSTEAD, M.D., to join him.

THE GREAT LIGHT.

THE DANFORD Atmospheric Lamp.

This Lamp burns coal oil, requires no chimney, gives a pure white and steady flame, uses thirty per cent less oil than any other lamp in proportion to the amount of light afforded, and is absolutely indispensable in every house where gas is not used.

Assayer and Chemist.

A GENTLEMAN WELL VERSED IN ASSAYING AND Analytical Chemistry, is desirous of securing a position in some assaying establishment, or would take charge of the assaying and amalgamating department of either a gold or silver mine.

San Francisco Metal Market.

Table with columns for Commodity and Price. Lists various metals and alloys.

EQUINE MORTALITY.—This city appears to be as healthy for animals as for man.

In the late report of the Omnibus Railroad Company it is stated that the annual rate of deaths of horses belonging to that company is about two per cent, while the death rate among animals engaged in the same service at the East is from seven to eight per cent.—from three to four times as great as in this city.

MORTUARY.—The mortuary report for this city for the week ending July 20th was fifty-two.

The causes of death were thirty-three in number.

CONTINENTAL Life Insurance Company

302 Montgomery street, corner of Pine.

DEWEY & Co., Mining and Scientific Press Office, San Francisco. 1417-1418

Latest Stock Prices Bid and Asked.

Table with columns for Stock Name, Bid, and Asked. Lists various stocks and bonds.

## Mining Summary.

This following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, July 20th: A contract has been made with the I. X. L. Co. for 100 tons of their ore, to be worked in Davidson's mill, on Silver creek. The price paid for the ore is \$100 per ton. It is thought that the quality of ore comprehended in the contract will work so as to leave a margin of profit to the mill. Once started, it is believed this will furnish sufficient from the amount saved while prospecting their lodes to keep the mill running on first-class ore.

It is thought that two or three claims on the Hercules lode will be worked this season. The Hercules is an undoubted true lode, and shows the finest quartz to be found outside the Comstock. All it wants is opening to a sufficient depth, where pay ore is a sure thing.

The Supt. of the American Co. is putting things to right, preparatory to starting up work. The wheel used last season for driving the pump is now running.

It is the intention of the owners to start work on Bnckey's No. 2 lode in a few days. Their vein is two feet thick, the whole of which will work over \$80 per ton. It is likely the pay ore will increase with distance and depth under ground.

## Anador County.

*Ledger*, July 20th: Sylvester, Spagnoli & Co., at Clinton, have been working a hydraulic claim near that place for some time past. Chipsas weighing from a half ounce to two ounces are a common occurrence, and smaller ones in proportion.

After the burning of the shaft house and machinery at the Italian mine, on Else creek, the owners, to keep their mill going, re-opened an old tunnel, striking ore so rich that after throwing out one-sixth of it the balance would pay \$2 per pound.

On Monday last, Dr. Pangh, of this place, sold his mine and mill, near Clinton, to parties in San Francisco and Oakland. The price paid has not been made known. The new owners will push forward the work vigorously.

The Mountain, or Belding, mine has been yielding a better quality of ore for the last two months than usual. Much of the rock will yield from \$80 to \$100 per ton, mill working. The depth of the mine is 250 ft., and though the size and general appearance of the lode is unchanged, the quality of the sulphurets is improving.

## Butte County.

*Marysville Appeal*, July 18th: A Frenchman passed through Marysville lately on his way to Paris, who met with unusual luck while mining in the Last Chance claim, in Butte county. He had sold his claim for a fair sum, with the privilege of working two days longer; and while thus engaged was lucky enough to take out a nugget weighing 50 ozs.

## Calaveras County.

*Chronicle*, July 20th: Lamphear & Co. are progressing fairly with their lead. The ledge is between two and three ft. in width, enclosed between well-defined walls, and the rock extracted prospects richly. Should the lode continue to prospect as favorably to the depth of 150 ft. as it does at present, the company will erect suitable machinery as soon as practicable.

From Middle Bar the most cheering intelligence is received. Stewart & Co., Hoerchner, Grimm & Co., and Wesson & Co., are pushing forward labor upon their claims with redoubled energy. The custom mill at that place is kept constantly employed, and the returns are highly remunerative to the owners of the leads. During the coming fall mills will be erected upon every lead in the district.

Large amounts of dust continue to be shipped from the West Point, Whisky Slide and El Dorado Dists. Wallace, Cockley & Co., Peters, Champion & Co., and many others, are coining money.

Pennell, Savage & Co., whose gravel mining claim is located in Stockton Hill, have recently struck it rich.

Paul & Co., after having cut their way through solid bedrock for a distance of about 900 ft., have had their labors rewarded by striking a lead of paying gravel. The claim is one of the most extensive as well as the richest in the county.

Shaw & Co., Brackett & Co., and Mitchell & Adams are doing remarkably well. Mining operations, both in quartz and gravel, are livelier in this vicinity than they have been for years past.

A new vein has been struck in the old Crispin mine. The lode is between three and four ft. wide, full of sulphurets, and with considerable free gold, visible to the naked eye. It is easily worked, without

blasting, crushes well, and prospects better than any rock heretofore struck.

## El Dorado County.

*Placerville Courier*, July 20th: At Brownsville all the ledges that are being worked look well. G. W. Swan and others are putting up a mill on a ledge owned by them. The Gray Eagle mill is running regularly, and has been for the past year or two. The old Steely ledge has changed hands, and is now being worked by Wm. Givens, of Sacramento. They are sinking their shaft, and on the 4th of July got through the old rock, and are now getting out rock that will pay \$25 per ton. The new mill at Henry's Diggings has just commenced crushing. Rock from Bradley's ledge, at Henry's Diggings, shows free gold, and looks well.

Prospecting is still going on at Georgetown, and all feel satisfied that they are entering upon a season of prosperity.

## Inyo County.

A correspondent of this paper, writing from Inyo county, says that the Silver Sprout Co's mill, five stamps at present, is nearly ready for work, and good ore is being taken from the mines. This company intends to make the concern pay its way when once started, devoting the proceeds to improvements, such as roasting furnaces, etc., till all is complete. As the surface ore can be worked with good results raw, they expect to be able to do this.

The Kearsarge Co. have at last got to work, and have sent a superintendent, who seems to be the right man. He is determined to understand the situation, and to that end is operating vigorously on the mines at several points. The mill will not be started until something more is known of the mines, which, though rich, are, like the others, not yet properly opened.

From Lone Pine we have the most flattering accounts of the mines, but water is very scarce, even for drinking purposes. The Mexicans in this district continue to take out hulkion by means of their little furnaces, which they sell to the storekeepers in Independence. Some parties contemplate establishing an assay office in the latter town. A certain party at Lone Pine has a mine reported to be very rich, which he keeps under lock and key, allowing none to enter. He makes a point of disparaging the district, and thinks "the Mexicans won't stay there long," but has no idea of leaving himself. It is hinted that he desires to "annex" the whole district.

## Mariposa County.

*Mail*, July 20th: Mining operations on Bull creek are progressing favorably. On Hite & Kerrin's claims the vein presents a fine appearance, with well-defined walls, and prospects well. Loomis, Black & Co., working on the extension of the same, are getting some good ore. Sheelan is having a shaft sunk on his vein, with good prospects. Col. Arni intends to let a contract for sinking on the Mammoth lode on Bull creek, on the same range as the Hite & Kerrin mine.

## Nevada County.

*Transcript*, July 19th: The Eureka correspondent writes: Black & Young keep their mill constantly at work. They have about 80 men employed and their rock looks very good. The Jim mine is not working at present.

The machinery for Veach and Powell's ledge is expected next week. They have run a tunnel 180 ft. striking the ledge four ft. in width, with over 125 ft. back, and the rock shows plenty of free gold. There are about 100 men prospecting in this locality at the present time. The Golden Age, owned by Mulligan, O'Neil and Quinn, have struck their ledge. It is large, and shows gold and sulphurets. It is their intention to erect a 10-stamp mill on it the present season. The Birchville Co. are taking out rock which will average \$48 a ton. They are hauling their quartz to Black & Young's mill for crushing.

A shaft has been sunk on the Golden Eagle ledge 20 ft., striking the ledge three ft. wide. The rock looks well, and is interspersed with free gold. The company are now running a tunnel to strike the ledge 100 ft. from the surface.

Hunt & Pier have struck fine looking rock in their ledge on Gaston ridge.

New ledges are constantly being discovered, most of which prospect first rate.

July 20th: The claims owned by Delos Caultkins and others on Myers' Ravine, are yielding handsomely this season. The present owners purchased the ground some three months ago, for \$9,500, and since that time have cleaned up about \$5,000.

July 21st: The Bed Rock Tunnel and Mining Co. is incorporated for the purpose of running a tunnel in Johnson's Hill, Birchville mining district. They have already run 2,021 ft., and have let a contract to run 400 ft. further. At the point to which the tunnel is completed it is 419 ft.

to the surface. This tunnel will furnish an outlet for over a mile of mineral land, the range being that lying between Birchville and Kate Hay's Flat. The month of the tunnel opens into the Middle Yuha. When this tunnel is raised to the gravel it is estimated it will be nearly 5,000 ft. in length.

The Kennebec Co. have opened a shaft from their lower tunnel into the gravel bed. The lower tunnel is 950 ft. long, and opens the channel to the bottom 170 ft. below the surface. The new tunnel taps the blue lead and the profits are expected to greatly increase.

*Gazette*, July 18th: One-half of the U. S. Grant mine has been sold to San Francisco men. The amount paid was \$32,000. This company was incorporated a few days ago at San Francisco, and it is the intention of the present owners to erect a large mill and thoroughly develop the mine.

*Dutch Flat Enquirer*, July 20th: A few days ago a large specimen of ore from the Eureka mine at Grass Valley, was exhibited, which would, if reduced, yield \$10,000 or \$12,000 per ton. The specimen weighed about 100 lbs. and exhibited to the naked eye large quantities of free gold besides very rich sulphurets. A ton of sulphurets from the U. S. Grant mine at Meadow Lake, has been successfully worked at Grass Valley by the Eureka Q. M. Co. The metallurgist at the Eureka states that he experienced no difficulty in reducing them.

*Excelsior*.—*Transcript*, July 24th: From 50 tons of Green Emigrant ore, crushed at the California mill, an average was obtained of \$25.90 per ton. The rock is from 10 or 12 ft. below the surface. The company will make another crushing of 100 tons at an early day.

Fifty tons of rock from the Mohawk and Montreal ledge, worked in their new mill, paid \$20 per ton in free gold, yielding in addition a large quantity of rich sulphurets.

The Gold Run Phoenix ledge has been run 200 ft., striking a large ledge with 150 ft. hacks. The ore is of excellent quality, abounding in free gold.

On the Knickerbocker ledge, a drift has been run 150 ft. below the surface. The company is taking rock from the top which will be crushed in a short time.

The Confidence Co., Pacific ledge, are assorting rock which was taken out last winter to be worked. It is estimated that this rock will pay \$40 per ton.

The Kentucky Co. are about letting a contract for a tunnel 200 ft. in length, to tap their ledge 150 ft. below the surface.

*Meadow Lake Sun*, July 20th: A very rich body of ore has been struck in the Gold Run mine, at a distance of 230 ft. from the mouth of the tunnel. The ledge seems to be widening considerably.

The Live Oak boys, being so well satisfied with their prospects at a distance of 18 ft. on their ledge, are building an arastra, in order to prospect more thoroughly.

## Placer County.

The Grass Valley correspondent of the *Alta* of this city, writing July 10th, says: Placer county is comparatively poor in quartz, the poorest in fact, between Plumas and Mariposa, if we take development as a fact of wealth. No quartz mill has paid regularly for three years, nor has any one furnished a total yield of \$100,000. The Green Emigrant has contained some very rich pockets, and rumor says it has yielded \$500,000. The owners refuse to tell what the yield has been, and there is good reason for believing that, for the first two years the product was \$20,000.

The yield of the Schnable mine is \$6 per ton, and the expenses \$4. A level has been run 1,200 ft. on the vein, 50 ft. below the surface in pay rock all the way.

The Empire quartz mill was burned down about 10 days ago.

The Tallman and the Golden Rule mines are both being opened. They both promise to be profitable.

*Dutch Flat Enquirer*, July 17th: Parties who have been in the mountains prospecting, report good diggings, both surface and quartz, to have been struck near the headwaters of the American river.

## Plumas County.

The Quincy correspondent of the *Alta* of this city, June 11th: The ledges next the Rough and Ready, in Jamison Dist., are large and well defined. There are upwards of 20 on the hill, most of which have been well prospected. The most prominent are the Manhattan, Knickerbocker, Empire, Savage, New York, U. S. Grant, R. E. Lee, Abe Lincoln, and McGee. Rock from the Knickerbocker and U. S. Grant have paid \$25 in the mill. The Manhattan and R. E. Lee prospect upwards of \$100. Free gold can be seen in the rock in any of the ledges. The rock in all of them is precisely similar in character to the Mammoth, Eureka, and Seventy-Six. They range in width from

four to eight ft.—the Savage is nearer 80 ft. All the rock may safely be estimated to pay \$20 per ton in mill.

McGee & Woodward are erecting a mill on a ledge purchased by them last winter. The ledge promises to be valuable.

Iron is found here in unlimited quantities. In one place an entire mountain is composed of the best rock ore, containing from 45 to 75 per cent. A party have located 320 acres on the iron mountain.

There are large copper ledges in this district located, but not yet developed.

## San Bernardino County.

*Guardian*, July 20th: Some few weeks ago Messrs. Brown and Tyler discovered a quartz ledge, and have lately been at work on it to test its richness, average pay and permanency. They have built an arastra for crushing the ore, but, although the rock prospects very well from mortar, horn spoon or pan, the amalgam obtained from the arastra so far, has been in small and not paying quantities. The ledge is about three ft. in thickness, and can be traced on the surface for several hundred yards.

We learn from a friend that the Green lode, after a run of 20 days, working 20 tons of ore in five arastras, recently cleaned up nearly \$800—about \$40 to the ton, which we understand to be about the average yield of some 1,500 tons of ore, worked by the Ryerson process. This process involves the necessity of dry crushing. The mode of crushing adopted was the Howel Centrifugal crusher. The result, notwithstanding the yield, was a heavy loss. Working the ore by arastras, affords a profit of about 100 per cent.; while by the Ryerson process, an actual loss is entailed.

## Sierra County.

*Messenger*, July 20th: The Dutch Co. have been taking out large pay for some time past. The Hawkeye Co. are driving their tunnel into the hill and expect to soon strike the lead. Bigsby & Co. have commenced operations upon their claims in Wolf Creek with flattering prospects. Scott, Miley & Co. are opening a set of claims at Bunker Hill. There is a heavy bank of gravel about 60 ft. deep. They intend to work them with hydraulic and tunnel, as the gravel pays from the top down, and they find large pay on the bedrock in the claims. There is also an extensive bed of cement that will pay richly for crushing. There has lately been a fine quartz ledge discovered near American Hill, known as the Von Humboldt ledge. The company are sinking on the ledge, which is between three and four ft. in width. All the quartz taken from the ledge is good. It will mill at least \$50 or \$60 per ton.

A gang of Chinamen, working near Kanaka Flat, recently found a nugget of gold weighing 45 lbs. The strike was kept secret until the gang was well on its way to China. Many large pieces of gold have been found in the diggings in that vicinity.

Now diggings have been discovered near Galloway's ranch. Owing to the absence of water, those working them are obliged to haul their dirt to Rock Creek, a distance of over half a mile.

*Meadow Lake Sun*, July 20th: Quite an excitement has been raised over a gravel deposit, discovered near Milltown, Sierra county. The extent and value of the discovery is not yet known.

## Yuba County.

The *Commercial Herald and Market Review* of this city, says: The Blue Gravel claim at Smartsville is a specimen of mines in Yuba. This claim contains upward of 100 acres, averaging 100 ft. from surface to bedrock. Upward of \$1,000,000 have been taken from it, though it was not opened till March, 1864. It occupied nine years of incessant labor, and the expenditure of upward of \$100,000, to open it. It has four miles of sluices, three ft. wide and three ft. deep, in which three tons of quicksilver is distributed to catch the gold. One hundred and twenty-five thousand lbs. of gunpowder are annually expended in blowing up and breaking the cement where it is too hard for the hydraulic to wash. The water used in washing costs \$25,000 per annum.

## BRITISH COLUMBIA.

*Cariboo Sentinel*, May 23d: Wake-up-Jake claim has been sold for \$100. Borealis Co. cleaned up lately in one day 156 ozs.

May 27th: The West Britain Co. bottomed a shaft at 47 ft. and got a prospect of \$2.50 to the pan. Cariboo Co. cleaned up, on Wednesday, 47 ozs. Davis Co. cleaned up, in one week, 130 ozs. Borealis Co. cleaned up, for one week, 100 ozs.

At Conklin's Gulch, Ericson Co. washed up, last week, 60 ozs. Ericson Co. washed up, on Wednesday, 124 ozs.; on Sunday, 131 ozs.—making 255 ozs. for the week.

May 30th: At Antler creek, Cunningham creek, Stevens' creek, California creek and Wolf creek, the companies are all doing well.

June 3d: At Conklins' Gulch, the United Co. washed up, for one week, 335 ozs. The Small Hope Co., at Begg's Gulch, last week found a piece of gold worth \$25. On Grouse creek, the Black Hawk Co. cleaned up, during the last week, 215 ozs. The Morning Star claim was lately sold at Sheriff's sale for \$370.

June 17th: During the past week, the Davis Co. cleaned up 99 ozs., and the Aurora Co. 142 ozs. Borealis Co. yesterday cleaned up 47 ozs. The Alturas Co., at Stont's Gulch, cleaned up, the past week, 140 ozs. The Jenkins Co. are making from \$10 to \$12 per day to the hand. The Mucho Oro Co. have cleaned up for the week 50 ozs.

The editor has been shown a piece of rock from the Washburne Co's claim that was literally speckled with heavy nodules of gold.

June 20th: The Aurora Co., on Williams' creek, cleaned up, during the past week, 220 ozs.; Davis Co., 206 ozs., and Forest Rose, 30 ozs. Borealis Co. cleaned up, yesterday, 45 ozs.

At Stont's Gulch, during the past week, the Alturas Co. cleaned up 161 ozs. One piece was found weighing 7 ozs. and another 3 ozs. The gold in the gulch is very coarse. Mucho Oro cleaned up 60 ozs. Vaughan, Sweeney & Co., having occasion to clean up a portion of their ground sluice to make room for rocks, washed up 100 ozs. Several pieces of gold have been picked up on the Ancient Britons' claim, in Begg's Gulch, weighing \$5 and \$6.

The *British Colonist* states that a piece of rock weighing 150 lbs. has been blasted from the Cherry Creek ledge. Samples of lead ore from Shuswap Lake assayed at Westminster have yielded at the rate of 64 per cent. lead and \$23 silver per ton.

June 4th: A 4 1/4-oz. quartz specimen has been taken out of a bench on French creek. The Windgam Co. are taking out from 6 to 10 ozs. per day. Daggart Co. had taken out a \$2,000 dividend to the share since the season commenced. The Gold Hill Co. were taking out at the rate of \$30 to the foot width of tunnel.

**COLORADO.**

Georgetown *Miner*, July 4th: A correspondent writing to the *Miner* of above date, from Colorado Gulch, says: We have plenty of gulches here that will pay \$4 or \$5 per day to the man. An old California miner has located some lodes near Cash Creek, from one of which he has obtained \$1 to the pound of ore.

The Henry Clay lode on Saxon Mountain, has turned out some fine specimens. The lead shows an ore vein five ft. wide, giving large assays. Work is being pushed energetically on the Terrible lode.

The owners of the Watertown lode have discovered another lode some 20 or 30 ft. farther up the hill, and will drive their tunnel on through the Watertown, and tap the new discovery.

The German lode have out about 600 tons of ore. It is sorted into two qualities. The second quality about pays expenses in ordinary stamp mills. The enormous per cent. of copper (15 per cent.) prevented the gold from being saved in the batteries, and on the plates. The first quality has not been tried. The shaft is 225 ft. deep. The crevice is six ft. between walls, with a vein of pure ore, varying from 18 in. to three ft. It is opened east and west for 2,600 ft.

More gulch mining is commenced and in contemplation than at any time since 1862.

The Herkimer Co. is pushing forward work on their mine steadily.

**IDAHO.**

Owyhee *Avalanche*, July 13th: The Owyhee Co's mill is again at work in better trim than ever before. The company is making an experiment in working the tailings by the Keut process. The tailings are first made into bricks, then calcined in a furnace and subsequently worked in barrels. If it proves profitable, works on a large scale will be constructed, and the tailings all treated by this process.

The Potosi ledge is producing rich ore. The shaft is down 40 ft. A number of assays show a very high average value of the rock. The lowest assay gave \$116.65, and several others ranged from \$800 to \$1,500. Silver largely predominates.

Ten lbs. of Glenbrook ore lately assayed \$19.93.

The Cosmos mill is working on Silver Cond ore with favorable prospects.

The Wolffoot mill is at work on Woodstock ore. The quality of the ore is improving.

In Flint Dist., work has been stopped on the Leviathan. The Sherman Co. are still engaged on their tunnel.

The Iowa & Idaho Co. have their grading for their mill nearly done.

**MONTANA.**

*Helena Gazette*, July 6th: The Big ditch of Marshall, will distribute its waters on three different bars. It will carry 1,400 in. of water. The gravel on the bars is from 10 to 15 ft. thick. Fishback & Co. have erected a large crank wheel on the Missourri river, capable of raising 180 in. of water, for washing gold on these bars. Last fall, parties on one of these bars made \$25 to the hand.

From Ten Mile and Monitor Gulches, there is most flattering intelligence. A number of very promising leads have been recently discovered. Messrs. Tuft & Donnell are erecting a smelter at the mouth of Beaver on Ten Mile Creek.

Fred. Cope lately concluded to run the Cope & Napton mill single handed. After running 36 hours, he cleaned up and came back to town with a brick worth \$579. Had he been able to clean the batteries, they would have yielded \$150 or \$200 more.

W. Y. Lovell, in giving a description of the ores in Brown's, Ramshorn, Silver Star, Hot Springs and Williams Dist., says the ores are all of gold and silver—the latter very handsome and of great value, showing native silver as well as the more important sulphurets. The veins are represented to be of great extent and ores easily extracted; and we are certain that no better locations for silver mills can be found in the Territory than those now presented in both Brown's and Williams' Dists.

A fine bed of fire clay has been opened in William's Dist., which has been tested and so far proven to be superior to any yet found that we know of in the Territory.

Post, June 6th: There are about 50 men employed on the Whitlatch, getting out ore. At the Gold Hill lode, Big Indian Dist., the shaft is down 70 ft., and a fine crevice of rich ore developed. They are at present sluicing decomposed quartz with fine results.

The St. Louis works at Argenta, are again in full blast. A cast wheel of pure silver was lately cupelled in the works.

Quite an excitement has occurred in Highland Dist., over two or three new discoveries of exceedingly rich quartz lodes. One, the Forest Queen, has a 40-ft. crevice, containing decomposed quartz, similar to the Ballarat, and prospecting as well if not better than that lode. The other, the Highland Chief, also has a wide and well-defined lode, containing decomposed quartz, prospecting free gold.

July 13th: Negotiations are pending between Prof. Marshall and Messrs. Hall and Foote, contemplating the purchase of the Gold Mountain lode. The sanction of the company was received, and 1,200 ft. ordered purchased for \$23,000.

The editor saw 1,153 ozs. of molten dross run into a brick at Bohm & Molitor's lately. Its net value was \$20,160 in coin.

A nugget has been taken from Hall's claim on Trinity Bar, weighing \$154. There are some nine or ten sluices running night and day on the bar, and they clean up every 10 hours, from \$150 to \$200 to the sluice.

At B. the City the placers are paying well. One company cleaned up 116 ozs. after a six day's run; another in the same time, 68 ozs, and another in a five days run, turned out 70 ozs. Five hundred ft. of the Mountain Chief lode was sold a few days ago, price not given.

**MEXICO.**

*Santa Fé Gazette*, June 29th: New diggings have been discovered on the headwaters of the Cimarron. An extent of ground, seven or eight miles long by half a mile in width, has been found to contain flour gold in paying quantities, and higher up the river and at other points coarse gold has been found. Numbers of men are now sinking shafts to strike the bed rock. One shaft at the depth of 11 ft. gave three cents to the pan, coarse gold, with pay dirt from the surface down. Some Mexicans are reported to be making from \$5 to \$8 per day with pans. There were about 200 men on the ground, and more were constantly arriving. Further and richer discoveries are expected as the explorations become more developed. A ditch, with 2,000 inches of water, will be brought on the flour gold patch by the 15th of August.

**NEVADA.**

*Pahrangat*.  
*Reveille*, July 16th: A rich strike has been made on the Illinois ledge 200 ft. below the surface. A piece of the ore assayed at the Keystone mill, yielded at the rate of \$843.82 silver per ton. The ledge is 25 ft. thick on the surface; its width has not yet been ascertained, although four ft. of good mineral has been developed. The joy at Pahrangat was great, and the sight of the metal, highly pleasing to eyes long unaccustomed to the sight.

June 15th: The vein of the Illinois ledge, belonging to the Pahrangat S. M. Co., has been struck, at a depth of 200 ft. below the

croppings. The ore will yield at a high rate.

**RESE RIVER.**

*Reveille*, July 16th: In Hot Creek Dist., a shaft has been sunk 50 ft. on the Indian Jim ledge, and a cut made across the vein, from which rich ore was taken, the choicer samples of which assayed as high as \$800 per ton. The Southern Light has been opened 40 ft. down, and shows a vein 12 ft. thick, in which there is a stratum three ft. thick of a good quality of ore.

Work is about to be commenced on the Silver Glance, Virginia, and other promising ledges in the district. The Providential Co. are at work on the Hot Creek ledge, having four months to prospect it in with the option of taking it at an agreed price.

The Adriatic, a lately discovered ledge, is producing a fine grade of ore, 3,100 lbs. which were worked last week at the Keystone mill, yielded at the rate of \$334 per ton. Another batch of the ore has just been delivered at the mill, which is pronounced to be superior to the first lot. The present appearance of the ledge is highly promising.

A large part of the machinery for the Boston & Reading Co's mill at Hot Creek Dist., is in the district. An effort will be made to have the mill running in 40 days.

There is an extensive saline deposit 25 miles eastward of Hot Creek, upon which a company is organized for the manufacture and supply of salt.

Yesterday 3,825 ozs. of crude bullion were brought into town from the Rigby mill in the district of San Antonio.

The Pino Grove correspondent of the *Territorial Enterprise*, of July 12th, writes: During the month of June, the Pioneer mill crushed rock as follows: Midas Co., 53 tons; Wheeler, 8 tons; Burlesque, 40 tons; Mountain View, 11 tons—total 112 tons.

At Penrod's arastra mill, there were crushed 13 tons second class and 15 tons first class Midas ore, four tons Imperial and Grant Consolidated, four tons Poorman, and 30 tons first class and 17 tons second class Wheeler—total, 85 tons—all of which equaled the expectations of those interested. The Imperial and Grant paid the best, netting nearly \$100 per ton. Mr. Penrod purchases nearly all the rock he works on the dump. He is, however, always willing to do custom work.

Sixty-six hundred lbs. of the Midas ore taken to Silver City by Mr. Briggs, and by him worked at the Eagle mill, yielded at the rate of \$114 per ton.

*Enterprise*, July 10th: A gold bar weighing 20 1/4 ozs., .831 fine, and valued at \$347.86, from the Imperial mine, Pine Grove, has been received and assayed at the office of Bulling & Co.

*Trespass*, July 17th: A fine specimen of sulphuret ore has been received from the Chihuahua mine, Newark Dist. The ore is very rich, and in several places horn silver is discernible. The ledge is about 12 ft. in width, and is opening up in increased richness.

*Trespass*, July 20th: There is in course of construction a 10-stamp mill at Park Cañon. There is an abundance of ore in the district working over \$80 per ton. The south lode is being worked vigorously. On the north lode, but little has been done, sufficient, however, to disclose a considerable body of chloride. The rock pays from a few dollars up to \$75 per ton.

*Meadow Lake Sun*, July 20th: Pine Grove Dist. begins to supply bullion to an encouraging amount. The Imperial mine produced from four tons a bar weighing 20 1/2 ozs., .831 fine, and worth \$347.86.

*Reveille*, July 19th: The pans and gearing for Coover's 5-stamp mill, in Bunker Hill District, will be propelled by water power. The builders have contracted with the owners of the Victorine mine for 1,000 tons of its ore. The Victorine is of great size, and will yield thousands of tons that will yield from \$45 to \$75 per ton. The ore contains a good percentage of gold. The mill will be arranged for wet crushing.

Prospectors from the headwaters of Goose creek report themselves unsuccessful in discovering gold in either placers or quartz ledges.

Two boxes, containing crude bullion to the amount of 3,100 ozs., has arrived from the mill of the Social and Steptoe Co., in Egan Cañon.

**WASHOE.**

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

*Gold Hill News*, July 16th: At Dayton, the Carpenter & Birdsall mill, with its splendid water motive, is thundering out the bullion with incessant labor. The Rock Point mill is more fruitful than ever before.

*Enterprise*, July 21st: During the past week, Wells, Fargo & Co. shipped 6,202 lbs. of bullion, valued at \$177,727.22.

*Enterprise*, July 23d: The workmen in the Crown Point mine have struck some very rich ore in the lower level, eastern drift. The stratum at the point where it was cut was about 3 ft. wide, we believe. How much wider it may prove to be when followed down remains to be seen. There was very rich ore above it in the same section of the vein.

On Friday last the new plunger pump for the Sierra Nevada mine passed through town on its way to the works. It is one of the largest in the State, being 14-in. bore and 12-ft. stroke. It was manufactured at the Nevada Foundry, Silver City.

**UTAH.**

*Vedette*, July 13th: Everybody is going to Green river, or sending a man. Brigham Young has sent four of his sons. We have no doubt that rich deposits of gold will be found somewhere on Green river. The exact place is still a secret, so far as the public is concerned. The discoverers are Mormons. The editor says "our advice to all outsiders, is to wait awhile! If the report should be true, that rich and extensive gold mines exist in the Green River country, we will know it soon, and will publish that fact, when we are satisfied that it is true, and not before."

Some parties that lately came by the new gold mines, report them rich. The location of the mine they fix at 25 miles northeast of Pacific Springs, across the head of the Sweetwater in the Wind River range. It appears to be generally conceded that this is the locality. In addition to the \$740, and the presents of \$60 distributed by the discoverers, an additional 40 ozs. has been disposed of in the city. The distance of the mines from Salt Lake, does not exceed 160 miles.

*Reese River Reveille*, May 15th: The editor saw a bar of bullion weighing 13 ozs., the product of gold dust and nuggets from Green river. The bar was worth \$400, gold and silver. The lot was clean and entirely free from quartz and clay.

June 15th: Porter Rockwell sent a dispatch to President Young from Green river as follows: "The mines are good, tell the boys to come."

FROM GRASS VALLEY.—A correspondent writes from Grass Valley, as follows, under date of July 20th:—"I visited the Eureka mine and mills. The new shaft of this company is nearly completed. It is to consist of four divisions, one for pumping, one for continuing the sinking of the shaft still further, and the other two for hoisting the ore. When it is completed the mine will be much better ventilated and labor facilitated. At present the mill is capable of crushing one thousand tons per month; but the proprietors intend increasing the number of stamps. The sulphurets are reduced in the company's own works, by Plattner's chlorination process. By the aid of an improvement lately added to the furnaces, two tons can be worked per day, which exceeds the supply of the mine. Considerable outside work is done.

This process works well with the Meadow Lake sulphurets, in working which great difficulty has been experienced, by those who have attempted their reduction near the mines. A ton of sulphurets was recently sent to the Eureka works from the U. S. Grant mine, and the result of the working is stated to be within five per cent. of the assay.

The Eureka has under foot in the tunnels over 1,000 tons of ore, ready for hoisting. The proprietors informed me that their average monthly dividend is \$30,000."

C. A. W.

SAN FRANCISCO, in proportion to its size, is the busiest seaport in the world. Her annual exports are about \$70,000,000, and her imports nearly as much; the manufactures are worth nearly \$20,000,000; the real estate sales amount to about \$12,000,000, and the cash value of the land, buildings and movable property of the city is about \$200,000,000, although assessed for taxation at only \$80,000,000. It sends away about forty tons of silver and six tons of gold every month—the former metal in bars fifteen inches long and five inches square; the latter in small bars about six inches long, three inches wide and two inches thick. Wagons loaded with the precious metals are seen in the streets nearly every day.

It is estimated that there are over 1,000,000 Frenchmen in the United States.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1886.

Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1886.

Dr. J. G. Yates is our duly authorized traveling agent. July 6, 1887.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1887.

Saturday Morning, July 27, 1887.

## Notices to Correspondents.

A YOUNG MINERALOGIST wishes to be informed of the rocks which are supposed to form the matrix or matrices of the diamond. This is a difficult query to reply to, as we have no very positively reliable information as to any evidence having yet been afforded where it can be satisfactorily affirmed that diamonds have been found in incontestible association with and accompanied by the rocks in which they were originally formed. Mr. Cliff, a very careful and attentive observer, conceives that the country and series of rocks from which the diamonds of Brazil were originally derived, consists of an elevated plateau of micaceous rocks, on which, so far as the eye can reach in every direction, the observer cannot discover the slightest trace of vegetation. The correctness of this opinion is somewhat confirmed by a communication from Kessel to Zerrner, wherein the former describes the diamonds of Borneo as being more particularly found in the districts of Landak, Sakajam and Tajan, and the Bayermassing country on the opposite or southeast part of the island. In both cases diamonds are described as occurring on a talcose rock, of from two to four yards in thickness, consisting of a bluish gray clay basis enclosing small white pebbles. It was long supposed that a conglomerate rock called itacolomite was the matrix of the diamond. The fact of it being found at all in the itacolomite, is doubtful, and still more so, even if found therein, whether these wonderful and beautiful specimens of crystallized carbon have been originally formed in itacolomite; or, at all events, that kind of conglomerate rock to which the name itacolomite was originally attached by such authors as Count Eschwege and others. The name has, however, been more recently applied to another variety of rock, to which we may hereafter recur.

PETER, Austin.—You are correct in conceiving that the acquirement of physical geology and paleontology requires, on the part of the learner, not only studies various and distinct, but also mental faculties of a diverse character. So much is this the case, that an accomplished physical geologist, such a one whose opinion might be relied upon as to the constitution of rocks and mineral veins, their probable formation and economic value, will usually be found but a smatterer in paleontology, which, in fact, is but a classic name for the natural history of ancient life, branching, consequently, into the science of anatomy and physiology. On the other hand, the paleontologist is generally deficient in the physical sciences relating to dynamics and chemistry, a profound acquaintance with both being required either to explain or understand most of the phenomena associated with physical geology. To become a practical man, however, it is essential that both branches of geology should be harmoniously studied.

SAVE YOUR FILES.—We are informed by Messrs. Durning & Fisher, proprietors of the Pacific File Factory, No. 53 Beale street, that nearly fifty per cent. can be saved by having old files re-cut. See advertisement.

## Improvement in Gas Lighting.

Much has been said and done, within four or five years past, with regard to improving the illuminating qualities of ordinary coal gas. It has been known that by passing coal gas over the lighter products of petroleum the latter is taken up, in a gaseous form, greatly to the improvement of the former. Various devices have been brought out for more effectually and readily effecting this union, and some twenty patents have been taken out to secure these inventions.

Quite recently a company has been formed at the East, with a large capital, which has bought up all that are valuable of these patents, and consolidated the numerous interests into one. This company is known as the "American Improved Gas-Light Company, of Virginia," and arrangements are being made to introduce the improvement into all places where gas-light is used. Mr. David Bush, formerly connected with the gas companies of this city and Sacramento, has recently returned from New York for the purpose of introducing it here, and may be seen at 708 Montgomery street, where the improved light is exhibited, in connection and comparison with the ordinary gas-light from the city mains.

The economy of this improvement has been most effectually established by various experiments in New York City and elsewhere. The New York, Boston and Richmond papers speak highly of both the increased illuminating qualities and decided economy of the improved gas. The Superintendent of the New York Tribune office says that an economy of fully one-half has been effected in the cost of gas in that establishment.

The result produced is perfectly philosophical; and is shown by Mr. Bush in a manner so simple and practical that conviction of its merits will be at once forced upon any one who will take the trouble to call upon him. The device hest approved and adopted by the company consists of a small iron box, whose interior is divided according to the annexed diagram:

The observer is supposed to be looking down into the box with the cover removed. The center partition, it will be noticed, is not carried entirely across. The two points at one extremity are to show where the gas is received into the box from the meter and let out to the burner. The interior of this box is first loosely stuffed with a fine, fibrous kind of shavings, the same which is much used instead of hair for stuffing mattresses; then a specially-prepared liquid—similar to naphtha, but less explosive—is poured into the box until nearly filled. The gas entering at the one opening has to pass through the saturated mass, around the end of the partition, and again across the length of the box to the place of exit. In its course it becomes "carbureted," as it is called, but, in fact, mingled with the naphthaline gases from the liquid—the liquid being gradually converted into vapor and thus mixed with the coal gas—the compound containing a larger proportion of carbon than the gas from the meter; hence its greater illuminating power.

There is no question as to the value and economy of the improvement, and we trust its management will fall into such hands as will allow the advantages to accrue to the benefit of the great mass of our citizens, rather than to the enrichment of a few.

INVENTIONS FOR THE EAST.—A party connected with this office, who contemplates a visit to the Atlantic states, would undertake the introduction of a few important inventions.

NEXT WEEK we shall make mention of the Central Pacific Railroad, and several mills and mines in Nevada county.

## The Wearing Away of Rivers.

The wearing away of the earth, by the action of streams, is familiar to all; but the vastness of this influence in modifying the surface of the earth is rarely appreciated, except by the professed geologist. In passing westward across the continent of North America, from the Atlantic to the Pacific, the regularly increased evidence of this action is noticeable at almost every stage of progress. In New England the action is but slight. The Connecticut river flows, for several hundred miles, through a broad valley but slightly depressed from the general level. Passing on to the Niagara, we observe that that river has excavated a valley, or rather a huge, narrow ditch, with almost perpendicular sides, so deep that the surface of the water, for some twelve miles below the falls, is over 300 feet below the level of the surrounding country. Passing still further westward, and into the Ohio valley, we find that river, between Pittsburgh and Cincinnati running, in one place, in a narrow channel some 700 feet below its original level; although in most places, this, as well as the Connecticut and Mohawk rivers, etc., have excavated quite broad valleys, with gently sloping sides, or peculiar offsets or steppes.

But it is not until the traveler has passed the crest of the Rocky Mountains, that he beholds the most extraordinary phenomena of this description. Very deep cañons are comparatively rare east of those mountains, while they become the almost invariable rule to the west of them. Two of the most remarkable instances of this character are, perhaps, the Black Rock Cañon, on the route from the Great Bend of the Humboldt to Goose Lake and Oregon, and the still more famous Black Cañon, on the Colorado, where that river flows through the Black Mountain region. The latter is considered the most remarkable depression, or rather excavation, of this kind in the world. The land of this region is an elevated plateau, and for many miles the head of the Colorado flows through it, in a narrow channel, 6,000 feet deep! The sides of this cañon are so steep that in some places, for miles on the stretch, no human being, not even a mountain goat, can pass up its sides. At one point there is a perpendicular wall, forming one of the banks of the river, over 5,000 feet high!

Throughout the entire western flank of the Sierra Nevada, the principal rivers, in the upper portions of their course, have generally cut their way down from 2,000 to 4,000 feet in depth, with banks upon either side rising at an angle of from 35° to 45° with the plane of the river. It has been supposed by many that these channels were formed before the rocks had become so much indurated as to present any very serious obstacle to their being worn away. But such could not have been the case, as we find that before the present river courses had an existence there was another system of rivers, running at almost right angles with the present water courses. In excavating into the heads of these ancient rivers, as the miners are now doing in thousands of places, in search for gold, we find the most unmistakable evidences that even they flowed over the country after the rock had become fully as much indurated as it now is. The upper branches of the American river have, in some places, worn their way 3,000 below the heads of these ancient streams. This entire distance must have been accomplished all the way through a hard slate rock. It is difficult to conceive the length of time which must have elapsed since this process of denudation had its origin. And yet there is good evidence for believing that this State must have been inhabited by man before this action commenced, as undoubted human remains are found beneath the debris of the ancient rivers, under circumstances which almost preclude possibility of their finding their

way there after the present river courses commenced their flow. If there is no mistake in these observations, the first existence of humanity on this continent must be referred to a period three or four times as remote as that usually fixed for the creation of man in the Eastern Hemisphere.

## The Late Boiler Explosion.

The steam boiler explosion of Saturday last should impress upon our City Council the necessity of providing a system for the more rigid inspection of steam boilers. It seems almost a miracle that so much damage and such wide-spread destruction should have been effected at mid-day, and directly in the midst of a populous neighborhood, without bodily harm to a single individual. The result has been most fortunate; but the lesson it teaches should be pressed home as strongly as though the horrible tragedy which might reasonably have been expected from such a result had actually occurred. It is to be feared, from the slight attention which appears to be paid to the accident, that nothing short of a terrible tragedy will incite our people and city rulers to a proper discharge of plain public duties.

Time was when such explosions were very generally attributed to some mysterious agent or principle connected with steam generation, which no human foresight could prevent; but careful and scientific observations have now pretty effectually established the fact that fully eight-tenths of all steam-boiler explosions are traceable directly to carelessness, ignorance, or defective boilers, which the most common intelligence and care may avert. Hence the necessity of more stringent rules and regulations for the construction, setting up and operation of boilers, especially where they are so generally distributed throughout populous neighborhoods, as they are in this city. The character of the iron, the form of construction, and the manner of bracing, are all important, and it should be the duty of some one to see that all the requisites are properly cared for. Such duty should be most carefully attended to. Hundreds and thousands of lives are dependent upon the proper performance thereof.

There is no evidence that there was any undue pressure of steam at the time of the explosion on Saturday; on the contrary, the evidence all goes to show a defective boiler—in this case, a boiler badly braced.

The accident by which the steam-drum was torn from the main boiler in one of the small steamers in our harbor, about a year ago, and destroyed several lives, was undoubtedly due to the same cause. Boilers, set in pairs, often owe their destruction to faulty connections, the mechanical work upon which is unexceptional—the fault being in the design. At least one such accident has occurred in the waters connected with this harbor. It should be made the duty of some person of proper experience and intelligence to look after such things, and, irrespective of friend or foe, to see that these dangerous but indispensable magazines of power are built and kept in proper order.

We have been thus particular in presenting the foregoing considerations in order that ignorance of the general causes of boiler explosions may not be held up as an excuse for defects of construction or recklessness in their use. As already stated, eight-tenths of all such accidents may be avoided by the use of a little care and attention.

ICEBERGS.—An unusually large number of icebergs have recently been seen in the North Atlantic. One vessel had to sail nearly 200 miles in a southerly direction along a perfect continent of ice, while others have met enormous icebergs much further south than they are commonly found at this season of the year. It is said that the presence of these large masses of ice have had a sensible influence on the temperature of the New England States and British Provinces to the northeast.

The Next Agricultural Fair.

The State Agricultural Society is making especial efforts to secure for their next annual exhibition a more than ordinary display of the varied industrial products of California. To that end, it has placed itself in communication with the Mechanics' Institute of this city, which, having no exhibition of its own to attend to this year, has promptly responded and taken favorable action in the matter.

The industry of this State is rapidly widening and increasing its operations, and the joint action of the two associations named, with anything like an active interest on the part of our people and mechanics generally, will not fail to secure for the next annual State Fair a success far beyond anything which has heretofore been met with. In order to do this, however, there is work to be done, and the people who are most directly interested in the result, must not stand idle, and leave everything to be attended to by the officers of the two societies. There is not a mechanic, manufacturer, farmer, or miner in the State, who may not add something to the grand result.

It is already time the work was commenced, especially on the part of our mechanics, who generally require more time than either of the other classes to prepare for such an exhibition. Let every one feel that he has something to do. If you have nothing to exhibit, talk—talk and induce others who have something to exhibit, to be up and doing. Every individual is more or less interested in securing a full and creditable exhibition. Do not think because you have nothing to exhibit, you have no interest in the matter. It is through such gatherings as these that men become more thoroughly and profitably acquainted one with another, and with the industries and resources of the State, in all their varied ramifications. An interchange of opinions and exhibitions on such an occasion, is worth months of solitary study and reflection. There is nothing like such things to sharpen one's wits, and open up new avenues for industry and employment.

The miners have also something at stake in this matter. If the exhibition does not put more gold into your claims, it will at least tell you how to get out what you have there to better advantage than you are now doing. Such will be the case with nine-tenths of you—both placer and quartz miners. Come up, then, to our great State Exhibition. Bring along your improved machinery and new ideas, and get others in exchange. If you don't benefit yourself, you may benefit another, which is the next best thing which you can do.

The *Bulletin* of this city has most appropriately observed in this connection: "That a thoroughly good fair will be particularly useful this year, when a larger amount of attention is directed to California from abroad than ever before—that is, on all points affecting her substantial and permanent interests. The leading Eastern journals now have correspondents here, who will form their conclusions and write largely of the resources and capacities of the State from what they see of them at the fair. For the mechanics and manufacturers of San Francisco to neglect the fair is therefore to neglect, in some degree, their own interests."

**MOUNT HOOD.**—It will be recollected that about a year ago Prof. Wood, the Botanist, reported to the Academy of Natural Sciences in this city, that he had ascended Mount Hood, and found it to be 17,500 feet high. The correctness of this statement was seriously doubted at the time by the members of the California Geological Survey, and others. Prof. Whitney, of the Survey, has just returned from Washington Territory and Oregon, and reports that he ascended Mount Hood, took careful barometrical observations, and found the height of the mountain does not exceed 12,400 feet. He does not know the precise height, as he had not time to calculate all of his observations.

HANSBROW'S CHALLENGE  
Deep-Well, Mining and Double-Cylinder Patent Pumps.

These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents,  
**LOCKE & MONTAGUE,**  
112 and 114 Battery Street, San Francisco.

**COMPLIMENTARY.**—Encouraging views of American affairs are not often announced from the other side of the Atlantic; but in the *London Economist*, of a late date, we find an article of which the following extract is a fair sample: "The United States have still the best possible land, the best mines, the best things above ground, the best things under ground, and an educated Anglo-Saxon race to make use of all of them. Such means and materials for production, and such skill in making, the world has never seen together. In consequence, wealth is created faster than ever before, and the government can tax it much more readily."

**THE PITTSBURG & SONORA C. & S. M. CO.** of Rio Chico, Sonora, Mexico, some time since tested 3,600 lbs. of their ore by the Mexican smelting process, and obtained a yield of \$1,100. This company has several mines, pronounced rich, two of which are extensively opened. Work has been steadily kept up on them for the past three years, and many tons of ore, equal to the above, have been broken down and stored up in the mine, under lock and key, for future working. A first class mill is nearly completed, and will soon be at work.

**INFERNAL MACHINE IN A LETTER.**—One of the clerk's in the Virginia City postoffice was recently canceling the stamp on a letter, when an explosion followed the stroke, attended by fire and smoke—the former being thrown in every direction and setting fire to several other letters lying near, and the latter filling the room. It is supposed that the letter contained a string of percussion caps upon tape, similar to those used in self-capping rifles, etc. Curious matter to find its way into Uncle Sam's mail bags.

**THE MARYSVILLE WOOLEN MILL.**—Active operations have been commenced in preparing the building intended for the Marysville woolen mill. Four sets of machinery will be put into service.

Six-Inch Mining Pump.

It is said that there are over 700,000 people in Ireland who speak the old Irish language exclusively.

Troy manufactures 10,000 tons of iron into stoves annually, the value of which is about \$2,000,000.

**NORTH AMERICA  
Life Insurance Company.**

Usual Restrictions on Occupation and Travel  
**ABOLISHED!**

Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.

The most Responsible and Liberal Company in the World!  
**J. A. EATON & CO.,**  
Managers Pacific Branch, 302 Montgomery st.  
20v14n9p SAN FRANCISCO.

**MARKET STREET HOMESTEAD ASSOCIATION.**—J. S. Lutz, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

Persons desirous of obtaining the finest Wood Engravings, can procure them only by having the picture photographed on the block, by  
**H. H. WOODS,**  
Address, No. 28 Third street. 19v14nfr

**Gold Bars,** of whatever size, if well cast, assayed for two dollars, at A. P. MOLLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint. 15v14-3m

**JACOB SMITH,** Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street,) takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 10v14nfc

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. **H. B. BEERS,** corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with PURE GOLD—thus restoring them to their original usefulness and beauty. Call and examine the work. Finest quality of artificial work also manufactured. 16v14-1f

**Builders' Insurance Company—**  
OFFICE IN THE BUILDING OF THE CALIFORNIA SAVINGS BANK, California street, one door from Sansone street.  
FIRE AND MARINE INSURANCE. 10v14n9pqr

**Brown's Filtering Heater.**—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler—repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to 5v14-1y AUSTIN A. WELLS, Agent.

**Perry Davis' Vegetable Pain Killer.**  
The universal remedy for internal and external complaints. At this period there are but few unacquainted with the merits of the Pain Killer, but while some extol it as a liniment, they know but little of its power in easing pain when taken internally, while others use it internally with great success, but are equally ignorant of its healing virtues when applied externally. We therefore wish to say to all that it is equally successful, whether used internally or externally, and its sale is universal and immense. The demand from India and other foreign countries is equal to the demand at home, and it has become known in those far-off places by its merits—the proprietors have never advertised it or been to any expense in its introduction into foreign lands.  
Sold by all Medicine Dealers everywhere. 2v15-1m

**Pacific Chemical Works.  
NITRATE OF SILVER.**

Messrs. FALKENAU & HANKS—Gents:—I have subjected the sample taken from your Nitrate of Silver to a thorough analysis, and find it to be chemically pure, not containing the slightest trace of any impurities whatever.  
Respectfully yours, THOS. PRICE  
Messrs. FALKENAU & HANKS—Gents:—I have examined the sample of Nitrate of Silver of your manufacture. I have never seen in this market, Nitrate of Silver, manufactured here or imported, so free of every kind of foreign matter, and find it not only adapted to Photography, but it was subjected to every mode of examination, aside from critical chemical analysis, and every test applied confirmed the opinion that a purer article could scarcely be produced or desired for medicinal purposes. H. L. LANZWEERT  
Nitrate of Silver manufactured by FALKENAU & HANKS, Pacific Chemical Works, San Francisco.

The highest price paid for Scrap Iron. 9v14m9p

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coling Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.** Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Wakie's pans, Beck's pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Fans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BOKING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT  
24712 **H. J. BOOTH & CO.**

A TOPOGRAPHICAL MODEL OF THE COMSTOCK LODE.—The Nevada *Trepass*, says: "A day or two since we visited the office of Mr. R. H. Stretch, Civil Engineer, and examined a plaster of paris model of the face of the country comprising most of Storey and Lyon counties, and the entire area which will be reached by the proposed Sutro Tunnel. The model has been a work of great labor, being built in sections, and is a perfect outline of the Comstock lode, with all its depressions and elevations, its mines, mills, and the towns and cities adjacent. Each spur of Mt. Davidson, Cedar Hill, Gold Hill, and the foothills to Carson river, stands in bold relief, and represented with the nicest accuracy. We know of no better way to form an idea of Mr. Stretch's model, without a personal inspection, than for one to imagine himself in a balloon, suspended over this city, 2,000 feet high, looking down upon the section of country embracing the richest mineral vein in the world. The model is to be forwarded to Sutro, who, by its aid, can practically demonstrate to any person who never was in Nevada, how absolutely necessary his grand project is, not only for the benefit of owners on the Comstock, but for the commercial prosperity of the whole world. It will also demonstrate how very probable it is that the tunnel will cut unknown veins of ore, rich in gold and silver; and more than all, when completed each stockholder will be certain to receive a handsome dividend on the invested amount of capital it requires to complete the grandest project of the century—grander and more beneficial to the world at large than even the famous Mt. Cenis Tunnel. Stretch has done his work faithfully, and it will redound to his credit."

It is said that the paper money now in use in Italy was manufactured in the United States. This country has acquired a widespread reputation for the manufacture of paper money.

PATENT SOAP is molded by pressure in dies, which are generally made of brass. The soap is first cut into blocks of a suitable size, and then pressed while in a semi-plastic state.

**Machinists and Foundries.**

13v14-ly

**MEN FOR POSITION.**—In these days of political excitements, when the multitude are looking eagerly around for those upon whom to bestow the favors of office, it may not be out of place for even a "class paper" to present the following suggestions, from Emerson, found in his "Representative Men:"

"The robust man, who stand at the head of the practical class, share the ideas of the time, and have the most sympathy with the speculative class. It is not from men excellent in any kind, that disparagement of any other is to be looked for. With such, Tallerrand's question is ever the main one. Not, is he rich? is he committed? is he well meaning? has he this or that faculty? is he of the movement? BUT, is he anybody? does he stand for something? He must be good of his kind. That is all that Tallyrand, all that State street, all that the common sense of mankind asks. Able men do not erro in what kind a man is able, so only that he is able—a master likes a master."

**THE PACIFIC IRON WORKS,**

**First & Fremont Sts., between Mission & Howard, San Francisco.**

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

EUROPEAN METALLURGICAL WORKS, Practical Mining School, Bryant Street, Between Third and Fourth, SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test 1. Ores sent to this establishment--either in large or small quantities--by such process as may be found best adapted to their chemical character, after a careful analysis has been made, and Ore adapted to the smelting process attended to. Sulphuretted, pyritous, and the so-called "rebellious ores" are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL. The proprietors--encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy--have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business. S. P. KIMBALL. J. R. MURPHY. 10v10

J. A. BAUER, Chemical Laboratory, AND DRUG STORE, 644 Washington Street. [Established 1849.] SAN FRANCISCO. Careful Analyses made of Ores, Minerals, Waters, Oils, Liquors, Wines, Products of Arts, etc. Pharmaceutival Preparations Made to Order.

Opinions given on Chemical Questions and Geology. Particular attention paid to Analyses of all kinds, in cases where legal questions are involved. Pure Nitric Acid, Nitrate of Silver, Gold Chloride, Platin Chloride, Sodium Amalgam, Sulfate of Copper, etc., for sale. 12v14-6m

LACOUR'S SARSAPARIPHERE BITTERS. Have so speedily grown in favor that their unrivalled sale has attracted remarks and criticisms of the trade. Jealousy attributes their success to the fineness of their general style, and principally to the originality and beauty of the bottle, which was conceived and manufactured by California artists. MR. LACOUR, an energetic promoter of California resources, desired to show that California has no need of being tributary to other countries for talent or mechanical industry. The cause of their success is the great benefit they have been to the large number who have already used them. MR. LACOUR is a graduate of the Polytechnic Institute of France, and adds to a thorough knowledge of Chemistry many years of experience; and, after a long and careful experimental study, has been enabled to offer

LACOUR'S SARSAPARIPHERE BITTERS. They are the most efficient Blood Purifier, because they combine with the wholesome Sarsaparilla, which operates by cutaneous excretions, and other substances which gently stimulate the secretions of the lower glands and organs, render digestion easy, obviate costiveness, and remove regularly every impurity of the blood. They are unrivaled as a remedy for Scrofula, Dyspepsia, Constipation, Liver Complaint, Nervous Affections, Colic, Intermittent Fevers, and all diseases arising from impurity of the Blood or Costiveness.

Who Takes Them? The Old Man Takes them as a gentle stimulant and mild rejuvenator. The Young Man Takes them to regulate his system, prevent disease, and stimulate to new life his overtasked body. The Young Woman Takes them to secure regularity in her habits; to tint her cheeks with the bloom of health; to give a sparkle to her eyes, and sweetenness to her breath. The Husband Takes them to promote vitality, give strength to the body, peace to the mind, and with his health, wealth and comfort to all his family. The Wife Takes them to invigorate and strengthen her system, and as an aid to nature in regulating her periodical sickness. Children Take them as a gentle, yet effective tonic. The Dasher Takes them as a mild, pure stimulant, containing none of the deleterious, essential and tussle of forbidden drinks. The Inebriate Takes them to give tone to his poisoned stomach and allay the fearful longings for strong drink with a stimulant that does not madden or destroy. The Traveler Takes them to prevent sea sickness, and secure his health against change of climate.

Everybody Takes Them! PRO BONO PUBLICO! 2v15-6m

New Mining Advertisements.

Gold Quarry Company, Location of Works: Placer County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twenty-fourth day of June, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Includes names like Hayden Judson, J. C. Beidman, R. C. Murray, etc.

And in accordance with law, and an order of the Board of Trustees, made on the twenty-fourth day of June, 1867, so many shares of each parcel of said stock as may be necessary will be sold at public auction, by Messrs. Duncan & Co., auctioneers, at the office of the Company, No. 705 Montgomery street, San Francisco, on Monday, the twelfth day of August, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. W. COLBURN, Secretary. Office 705 Montgomery street, (Room No. 4, 2d floor) San Francisco, Cal. j27

Lady Bell Copper Mining Company, Low Divide Mining District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of June, 1867, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to J. K. Johnson, at Crescent City.

Any stock upon which said assessment shall remain unpaid on the eighth day of July, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth (5th) day of August, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale, by order of the Board of Trustees.

B. P. WILKINS, Secretary pro tem. Office, 618 Market street, San Francisco, Cal. j22

Postponement.—The day for deeming stock delinquent on the above assessment is hereby postponed until Thursday, the first day of August, 1867, and the sale thereof until Monday, the 19th day of August, 1867. By order of the Board of Trustees.

B. P. WILKINS, Secretary pro tem. Office, 618 Market street, San Francisco, Cal. j22

Oxford Beta Tunnel and Mining Company, Esmeralda District and County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of July, 1867, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to the Superintendent at the mine.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the ninth day of September, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. H. PECK, Secretary. Office, 212 Clay street, San Francisco. j27

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of July, 1867, an assessment of one (\$1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 318 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixth day of September, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary. Office, 318 California street, Up stairs, San Francisco, California. j27

To Capitalists,

The mine has three main veins, and more than \$90,000 have been spent in opening them and completing the mill. Good prospects. Apply to BELLOC FRERES, Bankers, 23 1/2-31-6m 635 Clay street, San Francisco.

Mining Notices--Continued.

Adelta Gold Mining Company, Rock Creek, Sierra County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twenty-ninth day of May, 1867, the several amounts set opposite the names of the respective shareholders as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Includes names like E. F. Bauldwin, E. F. Bauldwin, etc.

And in accordance with law, and an order of the Board of Trustees, made on the twenty-ninth day of May, 1867, so many shares of each parcel of said stock as may be necessary will be sold at public auction, by Olney & Co., auctioneers, at No. 413 Montgomery street, San Francisco, Cal., on Monday, the fifteenth day of July, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. C. TAYLOR, Secretary. Office, 429 Pacific street, San Francisco, Cal. j29

Postponement.—The above sale is hereby postponed until Monday, the twenty-ninth day of July, 1867, at the same hour and place. By order of the Board of Trustees.

A. C. TAYLOR, Secretary. Office, 429 Pacific street, San Francisco, Cal. j29

Camargo Gold and Silver Mining Company, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of June, 1867, an assessment of twenty dollars (\$20) per share was levied upon the capital stock of said Company, payable on or before the second day of August, 1867, in United States currency, to the Secretary, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the second day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twenty-sixth day of September, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary. Office, N. E. corner Clay and Front streets, San Francisco.

At a meeting of the Board of Trustees, held June 21st, 1867, the order levying assessment (No. 6) made February 14th, 1867, was rescinded.

N. C. FASSETT, Secretary. Office, N. E. corner Clay and Front streets, San Francisco. j29

Casco Senores Gold and Silver Mining Company, Copalco, Sinaloa, Mexico.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the first day of May, 1867, the several amounts set opposite the names of the respective shareholders as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Includes names like Hayden Judson, J. C. Beidman, etc.

And in accordance with law, and an order of the Board of Trustees, made on the first day of May, 1867, so many shares of each parcel of said stock as may be necessary will be sold at public auction, by Messrs. Duncan & Co., auctioneers, at the office of the Company, No. 705 Montgomery street, San Francisco, on Monday, the twelfth day of August, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. W. COLBURN, Secretary. Office 705 Montgomery street, (Room No. 4, 2d floor) San Francisco, Cal. j27

Lady Bell Copper Mining Company, Low Divide Mining District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of June, 1867, an assessment of fifteen cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to J. K. Johnson, at Crescent City.

Any stock upon which said assessment shall remain unpaid on the eighth day of July, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fifth (5th) day of August, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale, by order of the Board of Trustees.

B. P. WILKINS, Secretary pro tem. Office, 618 Market street, San Francisco, Cal. j22

Postponement.—The day for deeming stock delinquent on the above assessment is hereby postponed until Thursday, the first day of August, 1867, and the sale thereof until Monday, the 19th day of August, 1867. By order of the Board of Trustees.

B. P. WILKINS, Secretary pro tem. Office, 618 Market street, San Francisco, Cal. j22

Oxford Beta Tunnel and Mining Company, Esmeralda District and County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of July, 1867, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to the Superintendent at the mine.

Any stock upon which said assessment shall remain unpaid on the twenty-fourth day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the ninth day of September, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. H. PECK, Secretary. Office, 212 Clay street, San Francisco. j27

Rattlesnake Gold and Silver Mining Company, Brown's Valley, Yuba County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of July, 1867, an assessment of one (\$1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 318 California street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-eighth day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the sixth day of September, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary. Office, 318 California street, Up stairs, San Francisco, California. j27

To Capitalists,

GOLD QUARTZ MINE, SITUATED IN CALAVERAS COUNTY, with steam mill fitted up with Amalgamating Pans, etc., FOR SALE. The mine has three main veins, and more than \$90,000 have been spent in opening them and completing the mill. Good prospects. Apply to BELLOC FRERES, Bankers, 23 1/2-31-6m 635 Clay street, San Francisco.

Mining Notices--Continued.

Adelta Gold Mining Company, Rock Creek, Sierra County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twenty-ninth day of May, 1867, the several amounts set opposite the names of the respective shareholders as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Includes names like E. F. Bauldwin, E. F. Bauldwin, etc.

And in accordance with law, and an order of the Board of Trustees, made on the twenty-ninth day of May, 1867, so many shares of each parcel of said stock as may be necessary will be sold at public auction, by Olney & Co., auctioneers, at No. 413 Montgomery street, San Francisco, Cal., on Monday, the fifteenth day of July, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. C. TAYLOR, Secretary. Office, 429 Pacific street, San Francisco, Cal. j29

Postponement.—The above sale is hereby postponed until Monday, the twenty-ninth day of July, 1867, at the same hour and place. By order of the Board of Trustees.

A. C. TAYLOR, Secretary. Office, 429 Pacific street, San Francisco, Cal. j29

Camargo Gold and Silver Mining Company, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of June, 1867, an assessment of twenty dollars (\$20) per share was levied upon the capital stock of said Company, payable on or before the second day of August, 1867, in United States currency, to the Secretary, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the second day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twenty-sixth day of September, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary. Office, N. E. corner Clay and Front streets, San Francisco.

At a meeting of the Board of Trustees, held June 21st, 1867, the order levying assessment (No. 6) made February 14th, 1867, was rescinded.

N. C. FASSETT, Secretary. Office, N. E. corner Clay and Front streets, San Francisco. j29

I. X. L. Gold and Silver Mining Company, Location of Works: Silver Mountain District, Alpine County, Cal.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the nineteenth day of June, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Includes names like Ayer, Isaac, Barron, Jas., etc.

And in accordance with law, and an order of the Board of Trustees, made on the nineteenth day of June, 1867, so many shares of each parcel of said stock as may be necessary will be sold at public auction, by Olney & Co., auctioneers, at the office of the Company, 415 and 420 Clay street, San Francisco, Cal., on the fifth day of August, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

FRANK H. HAMILTON, Jr., Secretary. Office, 415 and 420 Clay street, San Francisco. j20

Lyoa Mill and Milling Company, Keley District, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixth day of July, 1867, an assessment of three (\$3) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, 5 Government House, corner of Sansome and Washington streets, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the fifth day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the nineteenth day of August, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary. Office, No. 5 Government House, corner of Washington and Sansome streets. j13

Lady Franklin Gold and Silver Mining Company, Silver Mountain Mining District, Alpine County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the second day of May, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Includes names like John Birdsley, John Birdsley, etc.

And in accordance with law, and an order of the Board of Trustees, made on the second day of May, 1867, so many shares of each parcel of said stock as may be necessary will be sold at public auction, by Messrs. Olney & Co., auctioneers, at the office of the Company, 318 California street, San Francisco, California.

JOHN F. LOHSE, Secretary. Office, 318 California street, up stairs, San Francisco. j13

De Soto Gold and Silver Mining Company, Location of Works: Star District, Humboldt County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of July, 1867, an assessment of two (\$2) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company, No. 58 Exchange Building, northwest corner Washington and Montgomery streets, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the seventeenth day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the fourth day of September, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN M. RURNETT, Secretary. Office, No. 58 Exchange Building, northwest corner of Washington and Montgomery streets, San Francisco, California. j13

Gold Quarry Company, Location of Works: Placer County, California.

Notice is hereby given, that a meeting of the Stockholders of the Gold Quarry Company will be held in San Francisco, at the office of the Company, No. 705 Montgomery street, Room No. 4, second floor, on MONDAY, the twenty-ninth day of July, at 12 o'clock, noon, of that day, for the purpose of taking into consideration the increase of the Capital Stock of said Company, from the sum of six hundred thousand dollars, divided into six hundred shares of \$1,000 each, to the sum of two millions four hundred thousand dollars (\$2,400,000), divided into twenty-four hundred (2,400) shares of one thousand dollars (\$1,000) each.

G. D. ROBERTS, A. C. PEACHY, L. MAYNARD, I. FREEBORN, E. WERTHEMAN, Trustees of the Gold Quarry Company. T. W. COLBURN, Secretary. Office, No. 705 Montgomery street, San Francisco, June 24th, 1867. j29

Hope Gravel Mining Company, Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-sixth day of June, 1867, an assessment (No. 15) of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, at No. 629 Clay street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the thirtieth day of July, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the nineteenth day of August, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. P. GREENE, Secretary. Office, Room No. 11, 338 Montgomery street, San Francisco, California. j13

Neagle & Corcoran Silver Mining Company, Location of Works: Storey County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of July, 1867, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary of the Company.

Any stock upon which said assessment shall remain unpaid on the thirteenth day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the thirty-first (31st) day of August, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. F. VERDENAL, Secretary. Office, 22 Court Block, 636 Clay street, San Francisco. j13

Whitlatch Gold and Silver Mining Company, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of June, 1867, an assessment of fifteen dollars (\$15) per share was levied upon the capital stock of said Company, payable on or before the second day of August, 1867, in United States currency, to the Secretary, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the second day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twenty-sixth day of September, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary. Office, N. E. corner Front and Clay streets, San Francisco.

At a meeting of the Board of Trustees, held June 21st, 1867, the order levying assessment (No. 7) made February 14th, 1867, was rescinded.

N. C. FASSETT, Secretary. Office, N. E. corner Front and Clay streets, San Francisco. j29

Neagle & Corcoran Silver Mining Company, Location: Storey County, Nevada.

The Annual Meeting of Stockholders for the above named Company will be held at the office of the Company, Room No. 11, 338 Montgomery street, on MONDAY, the 19th day of August, 1867, at 7 1/2 o'clock P. M., for the purpose of electing officers for the ensuing year, etc.

A. P. GREENE, Secretary. Office, Room No. 11, 338 Montgomery street, San Francisco. j13

Nucera Senora de Guadalupe Silver Mining Company, Location of Works: Tayollita, San Dimas District, Durango, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of July, 1867, an assessment (No. 28) of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. Frazer, at the office, No. 210 Post street, or to the Treasurer, A. H. Hixson, at his office, No. 637 Washington street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirteenth day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the third day of September, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. PFEIFFER, Secretary. Office, No. 210 Post street, San Francisco, Cal. j13

Seaton Mining Company, Location of Works: Drytown, Amador County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twenty-eighth day of May, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Table with columns: Names, No. Certificate, No. Shares, Amount. Includes names like Wm Ashburner, Peter H Burnett, etc.

And in accordance with law, and an order of the Board of Trustees, made on the twenty-eighth day of May, 1867, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the office of the Company, No. 60 Exchange Building, northwest corner of Washington and Montgomery streets, San Francisco, Cal., on Monday, the twenty-ninth day of July, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

JOEL F. LIGHTNER, Secretary. Office, No. 60 Exchange Building, N.W. corner Washington and Montgomery streets San Francisco. j13

St. Louis Silver Mining Company, Cortez District, Lander County, Nevada.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the fourth day of May, 1867, the several amounts set opposite the names of the respective shareholders as follows:

Table with columns: Names, No. Shares, Amount. Includes names like Baldwin, John E., Berry, John, etc.

And in accordance with law, and an order of the Board of Trustees, made on the fourth day of May, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the saleroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on Tuesday, the second day of July, 1867, at the hour of 12 o'clock, noon, of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary. Office, 331 Montgomery street, San Francisco. j05

Postponement.—The above sale is hereby postponed until Monday, the 9th day of July, 1867, at the same hour and place. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary. Office, 331 Montgomery street, San Francisco. j05

Tuolumne Mountain Gold and Silver Mining Company, Old Buchanan Lodge, Tuolumne County, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of July, 1867, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, D. F. Verdenal, office, 22 Court Block, 636 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the thirteenth day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the thirty-first (31st) day of August, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

D. F. VERDENAL, Secretary. Office, 22 Court Block, 636 Clay street, San Francisco. j13

Whitlatch Gold and Silver Mining Company, Lander County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-first day of June, 1867, an assessment of fifteen dollars (\$15) per share was levied upon the capital stock of said Company, payable on or before the second day of August, 1867, in United States currency, to the Secretary, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the second day of August, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the twenty-sixth day of September, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary. Office, N. E. corner Front and Clay streets, San Francisco.

At a meeting of the Board of Trustees, held June 21st, 1867, the order levying assessment (No. 7) made February 14th, 1867, was rescinded.

N. C. FASSETT, Secretary. Office, N. E. corner Front and Clay streets, San Francisco. j29

THE MINING PRESS has entered upon its thirteenth volume. It is a valuable publication in its sphere, and its sphere is a large and important one. (Marysville Appeal, j29)

Machinery.

**VARNEY'S PATENT AMALGAMATOR.**

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and so to the circumference as before. This it constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp down and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

**PACIFIC FOUNDRY,**  
San Francisco.

**\$85 for Hunter's Improved Concentrator.**

The patentee is prepared to sell his Concentrators for the above price, and guarantees, when the machines are run according to directions, to give 25 per cent better results than from any Concentrator built on this Coast, and will refund the money if they will not perform what is claimed for them. Machines with copper plates, will cost \$10 extra. The Machine can be

Seen in Operation

At Booth & Co's Union Foundry, up stairs. Parties purchasing Concentrators will do well to examine before buying others of pretended merit. Persons desiring it can have a practical concentration made of tailings at any time, and prove the working of the machine.

**FOR \$50.**

**HUNTER'S EUREKA AMALGAMATOR.**  
For sale, the right to build and use in mills. A working plan will be furnished each purchaser. Five machines can be seen in operation at the Eureka Mill, Grass Valley. The cost of the iron for the machine, without the iron-box, is about \$100. The box will answer of wood.

By reference to the Mining and Scientific Press of May 25th, a full description of the above Machines may be found. For particulars, send for Circulars, or address

**ANDREW HUNTER,**  
Union Foundry, San Francisco.

**BLAKE'S PATENT QUARTZ CRUSHER.**

**CAUTION!**

The owners of the Patent for this valuable, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

**BLAKE & TYLER,**  
1414 1/2  
Agents for the Pacific Coast.

**QUARTZ MINERS, MILLMEN,**

And others contemplating the erection of Reduction Works, for either Gold or Silver Ores, your attention is called to a new, superior

**First Class Mill,**

In all respects, with Pans and Separators complete. The Mill is adapted for 20 or 40 Stamps.

Full particulars may be had by calling on Messrs. Palmer, Knox & Co., Golden State Foundry, or

**Brodie's Patented Improvements**

FOR THE TREATMENT OF  
**Gold and Silver Ores.**

**BRODIE'S PATENT IMPROVED QUARTZ CRUSHER.**  
The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:  
No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600  
No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....\$800  
No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

**EXPLANATION OF THE ABOVE DRAWING.**  
The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, B, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:  
RAWHIDE RANCH, Tuolumne Co., Sept. 29, 1866.

**JAMES BRODIE, Esq., San Francisco.**—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,  
R. P. JOHNSON,  
Supt. Rawhide Ranch Quartz Mill.

**BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.**—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.  
Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$200 per Barrel.  
A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

**BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.**—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations are afforded on application to the subscribers.  
A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

**THE CELEBRATED Self Generating Portable Gas Lamp.**

**Directions for Use.**  
Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the top off, it will gradually go out.  
When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.  
Manufactured solely by **JOHN J. BUCKS,** original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 15v14-3m

**E. O. HUNT, Manufacturer of Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.**

**HUNT'S ADJUSTABLE WIND MILLS** to have all the sails so arranged as to turn sideways to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person.  
**HUNT'S SELF-REGULATING WIND MILLS** are of a simple and cheap construction, and is provided with means for stopping in the most violent winds. This mill is well known throughout the State.  
Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double-Acting, Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Trucks built to order.

**ROOT'S PATENT FORCE BLAST BLOWER.**

Adapted for Smelting, Foundry, Mining and Steamships. Requires 50 per cent less power than any Blower now in use. For further particulars, address **KEEP, BLAKE & CO.,** Stockton, or Wm. T. Garrett, corner Mission and Fremont streets, San Francisco. 1v15-10pr

**National Mineral Land Law, Instructions, Blanks, Etc.**

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the United States Registers and Receivers and Surveyors General, from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address **DEWEY & Co.,** office Mining and Scientific Press, San Francisco.

**THE GREAT BRIDGE AT ST. LOUIS.**—Surveys and estimates have been made for an immense wire suspension bridge across the Mississippi at St. Louis. If the project is ever carried into execution, it will be the most costly one in the world, as well as one of the most splendid efforts of mechanical ingenuity in existence. It is intended to accommodate the great lines of railway centering at this point, as well as for the general accommodation of the public. The plan proposes that this bridge shall be over a mile in length and eighty-four feet above high-water mark, so that all steamers, of whatever dimensions, may readily pass under it without injury. The greatest distance between the towers to be 1,800 feet, and the bottom of some of these to be sixty feet below the level of the river at low water. Its erection will cost two millions of dollars. Another plan has been suggested to afford an easy means of communication between the two sides of the river; this—which will obviate the necessity of a bridge—to consist of an iron tunnel, or "vast iron tube," laid across the bed of the river, for the passage of railways trains and for the use of vehicles and pedestrians. Others propose that the tunnel shall be dug in the earth under the bed of the river. In either case, next to the Hoosac and Mount Cenis tunnels, this will be the most remarkable enterprise of the age. In comparison with it, those of Chicago and London will sink into insignificance.

**WYOMING** is the proposed name for a new Territory which must soon be organized in the region of country on the eastern slope of the Rocky Mountains and to the north of Colorado. This region is as yet undeveloped; but enough is known of its immense deposits of gold, silver, copper and coal, to warrant the statement that within a short time it will equal Montana in population. The veins of coal alone will supply the Pacific Railroad with fuel for years to come. These veins are already being worked in Colorado. At Boulder City, north of Denver, there are five veins of a superior quality of coal, the largest being fifteen feet and the smallest five feet thick. At the crossing of the North Plate there is a coal strata among the rocks on the north side of the river. The other precious metals will be found equally rich. This Territory is bound to be settled up with a thriving population. The mines on Strawberry, now in Utah, are in this proposed new Territory.

**MOUNTAIN SILK.**—The Nevada Transcript of the 23d inst. says: "We have seen at the store of Gregory & Waite a spool half filled with raw silk, of a rich orange color. The threads are exceedingly fine, and very glossy in appearance. This spool contained the silk of two cocoons, and was raised by Messrs. Isoard & Muller. We yesterday saw a spool at Isoard's store, containing about the same quantity of rich white silk. They reeled, on Saturday, the silk of fourteen cocoons, which averaged 2,000 feet to the cocoon. Prevost says the flies produce an average of from 250 to 300 eggs. Those raised by Isoard & Muller produced an average of 400 eggs each. These gentlemen have about 60,000 eggs. They also have a fine lot of cocoons, which they propose to send to the State Fair."

**GOVERNMENT MINING TITLES NOT COMPULSORY.**—The Commissioner of the General Land Office, in issuing instructions to Registers, Receivers and Surveyors-Generals, relative to receiving claims under the Act of July last, says they should advise claimants to appear before the approval of the surveys, and all further proceedings will be stayed until final settlement. It is understood there is nothing obligating claimants to proceed under the statute, and when they fail to do so, there being no adverse interest, they hold the same relation to the premises they did before the passage of the Act, with additional guarantees. They possess the right of occupancy under the statute.

**IMPORTANT DISCOVERY.**—It is said that the Hudson Bay company's agents have discovered a practicable pass through the coast range via Gardner's Inlet, Lake Francois and Lake Fraser to Fraser River. Goods landed at Gardner's Inlet may be carried through the coast range to Francois Lake, where they will be put in canoes and boated through Fraser Lake and its feeders to Fraser River and Quesnelmouth.

**BAD LUCK** is simply a man with his hands in his breeches pockets and a pipe in his mouth, looking on to see how it will come out. Good luck a man of pluck to meet difficulties, his sleeves rolled up, working to make it come out right.

**POPULAR FALLACIES.**—That warm air must be impure, and that, consequently, it is hurtful to sleep in a comparatively warm room. A warm room is as easily ventilated as a cool one. The warm air of a close vehicle is less injurious, be it ever so foul from crowding, than to ride and sit still and feel uncomfortably cold for an hour. The worst that can happen from a crowded conveyance is a fainting spell; while, sitting even less than an hour in a still, chilly atmosphere, has induced attacks of pneumonia—that is, inflammation of the lungs—which often proves fatal in three or four days. It is always positively injurious to sleep in a close room where water freezes, because such a degree of cold causes the negatively carbonic acid gas of a sleeping-room to settle near the floor, where it is breathed and re-breathed by the sleeper, and is capable of producing typhoid fevers in a few hours. Hence, there is no advantage, and always danger, especially to weakly persons, in an atmosphere colder than the freezing point. That it is necessary to the proper and efficient ventilation of a room, even in warm weather, that a window or door should be left open. This is always hazardous to the sick and convalescent. Quite as safe a plan of ventilation, and as efficient, is to keep a lamp or small fire burning in the fireplace. This creates a draft, and carries bad airs and gases up the chimney.

**POPULATION OF THE UNITED STATES.**—Through the machinery of the Internal Revenue, a census of the population of the United States was taken last fall. It was taken quietly but thoroughly during six weeks of last November and December, and is, in most cases, the result of actual counts in the revenue districts. The returns from a few of the remote mountain districts are the only ones not deemed satisfactory. The census shows the population of the thirty-seven States to be 34,100,255 and of the States and Territories taken together 35,505,882. In most of the Southern States there has been a decrease of population, a slight increase in the Eastern States, and a large increase in the West. The increase since 1860 has been over 3,000,000, which, in view of the four years war, demonstrates the powerful recuperative powers of the country.

Emigration to the United States from Germany at the present time is more extensive than ever, many young men flying from the military service. A new sort of emigrants are the Czechs, but this is not attributable to political reasons, but to the impossibility of getting land to cultivate in a country where so much property is yet in the hands of the nobility and the monasteries.

**GOOSE LAKE.**—The Marysville Appeal says that a party of some twelve or fourteen is making preparations for prospecting the country near Goose Lake, in the eastern part of Siskiyou county, where they expect to strike good diggings.

**HINKLE & CAPP'S CENTRIFUGAL ORE GRINDER AND AMALGAMATOR.**

Patent dated April 16th, 1867.

For Grinding and Amalgamating Charges of Ore.

Arranged as shown in the first engraving, the pan is adapted for grinding and amalgamating separate charges of ore of 800 lbs. each, doing its work rapidly, thoroughly and effectually.

For Grinding and Discharging Continuously.

Arranged as shown in the second engraving, all the interior grinding parts being the same as shown in first view, the pan is adapted for receiving and grinding and discharging continuously crushed quartz as fast as supplied by a live stamp battery, with No. 4 or 6 screens. A "slimmer," or some similar contrivance, to carry off the clay, slime and surplus water, is to be placed between it and the battery.

This sectional engraving exhibits more clearly the arrangement and shape of the grinding parts of the machine. It, and the other engravings, will be more clearly understood by reference to the accompanying explanation.

Half Section or Top View.

**The Centrifugal Ore Grinder.**

This new GRINDER and AMALGAMATOR is extremely simple and compact in its construction. The principle availed of is entirely novel. The grinding is effected by perpendicular mullers, pressed laterally by centrifugal force against perpendicular iron dies, fitted to the inner sides of the pan. It is to be run at a speed of from 60 to 80 revolutions per minute, according to the hardness of the rock to be crushed. The pressure upon every part of the grinding surfaces is direct and uniform, and they wear with straight and true faces from first to last, conforming also to the shape of the sides of the pan, so that the work performed with old mullers and plates is as thorough and perfect as with new ones. The pulp enters readily between the mullers and side dies, the pressure being light in front and heaviest at the heel of the muller, there is no strain upon any of the parts, and no liability to breakage or disarrangement, and no wear except that which is useful on the grinding surfaces. The work done is performed without jarring, jerking, straining or clogging, with extreme regularity and evenness, the pulp being of great and uniform fineness. It is not liable to be clogged, nor to be obstructed, stopped, impeded or broken, by coarse pieces of rock, pick points or iron, accidentally introduced with the crushed ore, as these can readily pass each muller separately, without interfering with or affecting the other mullers, each of which is independent, or can rest upon the bottom below the mullers, without inconvenience, as the arms may freely pass each other.

It is more readily cleaned up than any other pan, as each muller can be lifted out separately by hand, and there is no necessity for lining the revolving cone or driver, which is also easily turned, there being no friction when not in use, or rapid revolution. The bulk of the mercury is not ground up with the rock, but lies below the lower ends of the mullers in a groove, and in another groove on the cover of the pan, where all the pulp and metal passes continually over it without cutting or carrying it away. The mullers and side dies are easily removed at any time, or when worn out, and an extra set of mullers is furnished with each pan sold. It is also adapted for grinding cement, sniupurets, roasted ores, etc.

**EXPLANATION.**—E, muller-batter; F, muller plate or shell; G, side die; H, supporting lip; D, bearing surface; T, feeder; X, weight to counter-balance wear of muller plates, or shoes. U, cover used in working charges of ore. The dark shade on the bottom of the pan represents one of the grooves for mercury.

We claim all these advantages for our Pan, and that it will do more and better work, with less power, and less attention and manual labor, more rapidly and with less expense, than any other pan or muller made for the same purposes, and claimed to be equal or greater capacity. We will sell them for use on condition that if, when fairly tried they fail to answer these promises, they may be returned.

For full description and illustration, see Mining and Scientific Press, June 15, 1867.

**Hinkle & Capp's Centrifugal Ore Grinder and Amalgamator**

May be seen in operation, and examined, at the European Metallurgical Works, on Bryant, between Third and Fourth streets, San Francisco, where all interested in mining and milling operations are invited to inspect it. Its weight, as arranged for continuous grinding and discharge, with extra set of six mullers, is about 2700 lbs.; or as arranged for grinding and amalgamating single charges of 800 lbs. of ore, also with extra set of mullers, about 3000 lbs. Price, as above, completely fitted and ready for use, either way, \$500, gold coin.

For further particulars, apply by letter to PHILIP HINKLE and CHARLES S. CAPP, No. 543 Clay street, below Montgomery, San Francisco, Cal. or personally to the above, or S. P. KIMSALL, Esq., at the European Metallurgical Works, on Bryant street, between Third and Fourth streets, or at the Miners' Foundry, First street, near Folsom, where they are manufactured.

Send for Circulars. PHILIP HINKLE and CHARLES S. CAPP, Patentees, 543 Clay street, San Francisco.

**COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.**

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.  
Steam can be gotten on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises), in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost corners of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.  
All sizes on hand from 3 to 30 horse power, with and without carriages.  
Also, Portable Saw and Grist Mills.  
For sale by  
**TREADWELL & CO.,**  
Corner of Front and Market streets. 9v14-6m15p

The Central Pacific Railroad.

OPENINGS FOR ENTERPRISE.

Mr. F. M. Shaw writes from Camp 20, Central Pacific Railroad, as follows: "As this great artery of commerce nears completion to this point and beyond, it may be interesting and profitable to take a brief survey of some of the various legitimate openings for enterprise and capital which it presents. The first paying business, and the one that will strike the observer most forcibly, is the timber and lumber production, and the facility with which it is convertible. The unlimited water-power of the Truckee and its tributaries offers unusual inducements for embarking in this branch of business. Who will doubt, for a moment, the profitableness of this business conducted by organized experience and capital, when we consider the demand that already exists for the product of the forest and saw mills throughout the entire mineral regions for two hundred miles eastward—entirely destitute of timber suitable for any purpose except fuel—and the increased demand which cheap transportation must inevitably create? The unlimited amount of water-power afforded should induce the manufacture of every article of utility capable of being produced from the pine, cedar and tamarac, such as all the varieties of finishing materials for buildings, furniture, sash, doors, blinds, buckets, staves, clapboards, shingles, laths, moldings, paneling, flooring, etc., to say nothing of fencing, logging and cheap lumber.

Next in magnitude and importance will be the getting out, sorting and reducing to shipping order the rich copper and silver ores so abundant in the Peavine and Humboldt districts. Already far-seeing and moneyed men are preparing to take advantage of these unequalled opportunities for enriching themselves, and it would be well if many more should come and take a share in the harvest which so surely awaits the enterprising."

**THE QUESTION OF LONGITUDE.**—The interesting and important question of the difference of longitude between this city and New York, which, it was thought, would have been definitely settled by the aid of the telegraph, ere this, will probably be postponed fully another year. This important question will doubtless be decided under the direction of Mr. George Davidson, in charge of the observations at this station; but not until after the completion of his present mission to Alaska and a return to the East for the instruments necessary for so delicate and difficult a determination. It may not be improper that we should mention the fact in this connection that Mr. Davidson, who has long been a most able and efficient member of the U. S. Coast Survey, will probably be assigned to permanent duty on this coast. His presence will be most welcome here, as he will be found a valuable acquisition to the rapidly increasing circle of scientists in this city.

**A LINE OF STEAMERS TO THE SANDWICH ISLANDS.**—The California, Oregon and Mexican Steamship Company, having secured a ten years' contract for carrying the mails between this port and Honolulu, with a \$75,000 per annum subsidy—service to commence on the first of January next—have signified to the Government their willingness to commence the service forthwith if duly authorized to do so. The propellers Montana and Idaho have been designated for the purpose. In the event of the proposed reciprocity treaty with the Hawaiian Kingdom, this line of steamers cannot fail to be of great commercial importance to the trade of this city and coast.

**MECHANICS' INSTITUTE.**  
Resources of California.

THE MECHANICS' INSTITUTE of San Francisco, hereby offer a PREMIUM OF ONE THOUSAND (\$1,000) DOLLARS for the best Essay on the "RESOURCES OF CALIFORNIA, AND BEST METHOD OF DEVELOPING THE SAME," under the following conditions: One-half of the premium in cash on the certified award of the Committee of Judges, and the balance from the first proceeds of sales of the successful work, which is to belong to, and will be published by, the Institute.  
The Essays are to be handed in to the Librarian of the Institute on or before the FIRST DAY OF JUNE, 1868, and the award will be made by the Judges at the opening of the Industrial Exhibition, which is to be held in August or September following. The Essay should be divided into three great heads, viz.: Mineral, Agricultural and Industrial Resources, with proper subdivisions of each subject. It should be sufficient in quantity to form a duodecimo (12mo) volume of from 250 to 300 pages long primer type, solid.  
Writers will sign their articles in cipher, and send their names and address in sealed envelopes, which will be kept in a secure place by the Institute, and only be opened when the award is made. The manuscripts of unsuccessful writers will be returned to them without publicity.  
The Committee of Judges have the right to reject all Essays in case they do not consider them worthy of publication or the premium. No further instructions than are contained in this advertisement will be given to this Committee, nor will they be subjected to any advice from the officers or members of the Institute in regard to their proposed action. All manuscripts submitted must be in clear legible writing, so as to admit of easy reading.  
The following named gentlemen, who have been selected for their well known ability, public spirit and integrity of purpose, will compose the Committee of Judges:  
Hon. Fred'k P. Low, Maj. Gen. H. W. Halleck, U. S. A.,  
Prof. J. D. Whitney, S. A.,  
James Oils, Prof. W. B. Ewer,

W. T. GARRATT,  
City  
BRASS AND BELL FOUNDER

Cor. Mission and Fremont sts.,  
SAN FRANCISCO.  
Manufacturer of Brass, Zinc, and Anti-Friction or Babbet Metal Castings;  
CHURCH AND STEAMBOAT BELLS,  
TAVERN AND HAND BELLS AND GONGS,  
FIRE ENGINES, FORCE AND LIFT PUMPS,  
Steam, Liquor, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder, and Copper Rivets, etc. Orange Cocks, Cylinder Cocks, Oil Globes, Steam Whistles,  
HYDRAULIC PIPES AND NOZZELS  
For Mining purposes, Iron Steam Pipe furnished with Fit tings &c. Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."  
Highest Market price paid for OLD BELLS, COPPER AND BRASS. 6v1

JOHN G. HODGE & CO.,  
Importers and Dealers in  
STATIONERY,  
Blank Books, School Books and Cheap Publications.  
WRAPPING PAPER,  
PAPER BAGS, ETC.  
Nos. 418 and 420 Clay street, San Francisco.  
Special attention given to orders from Country Merchants. 2v15 9r16p

**Foundry for Sale.**  
A One-half Interest in the  
UNION IRON WORKS,  
SACRAMENTO,  
Owned by William R. Williams, is offered for sale on the most favorable terms.  
A Good Bargain  
May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a rare and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 85 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets.  
Inquire at the office of the Foundry, or address  
WILLIAM R. WILLIAMS,  
Sacramento, Cal. 25v13tr9-16p

## The New Merchants' Exchange Building.

The history of commercial enterprise will be searched in vain for a parallel to the growth of the mercantile interest of San Francisco. The peculiar circumstances attending the early commercial growth of this city, appear to be fully equaled in their beneficial effects, by the remarkably favorable position which it occupies—a position which utterly precludes any possible rivalry

spirit and energy which animates them, while it presents an unmistakable index that the shaping of the high destiny which awaits the future of our city, has not been committed to inappreciative or unworthy hands.

San Francisco, a city of hut yesterday, can point to a structure for the daily rendezvous of her merchants, which, for extent, appointment, beauty and symmetry of construction, will compare favorably with any edifice of the kind which can be found, even

15th of July, 1867—a period, a few days only, in excess of a year—a most noteworthy instance of dispatch, aptly in keeping with the energy and enterprise of the pioneers of civilization on this distant quarter of the globe.

The building occupies a frontage of 126 feet on California street, and has a depth of 137½ feet on Leidesdorff street. It comprises two separate edifices, front and rear, connected by a covered court in the center, roofed over with glass. The front building is three stories high, with basement; the rear has two stories, with cellar and attic.

The latter is used by the merchants and the Board of Brokers; the former is devoted to offices exclusively, from basement up. The first floor of the rear building is divided into an Exchange and Reading Room, measuring 82 feet by 52½ feet, and a restaurant, 40 feet by 51½ feet; both are lofty, being 25 feet from floor to ceiling. In the second story the Board of Brokers have a chamber 42 feet by 51½ feet, and 20 feet high, and the Chamber of Commerce an apartment 40 feet by 54 feet, and 22 feet high. Both are provided with ante-rooms for telegraph and Secretaries' offices. There is an attic over the Board of Brokers' Room. The entire building is well lighted and ventilated, and supplied with water and gas throughout. The principal story of the front building comprises four spacious offices, 58 feet by 25 feet. There are seven offices in the basement, suitable for brokers—four of small dimensions on Leidesdorff street and three on California, 25 feet by 38 feet. The second and third stories are divided into 32 offices, for general business purposes. The basement is 10 feet in height; the principal floor 17 feet; the second story 15 feet, and third story 14 feet. There is a general entrance on California street, with four lesser ones, exclusive of entrance to basement offices, and one private entrance on Leidesdorff street. In addition to full supplies of gas and water, the apartments are provided with ventilating flues; water closets are convenient on every floor.

The building on California street displays a bold and open front; the Doric, Ionic and Corinthian orders are respectively to be seen in the first, second and third stories. The fourth story is Composite. The tower in front is 120 feet above the sidewalk. The tower contains a clock with four separate dials.

The building is surmounted by a balustrade, the pedestals on which are finished with cast iron vases. Two projecting cornices are embellished with prominent turrets, covered with lead. The dome of the tower is covered with the same metal. The building has cost something over \$170,000. The chief materials used are brick, wood and iron—the large amount of \$25,000 having been paid to Messrs. Hinckley & Co., of the Fulton Foundry, for the metal. Messrs. S. H. Williams & Son were the architects.

THE NEW MERCHANTS' EXCHANGE BUILDING.

Mt. Hood, Again.—The following communication explains itself:

EDITORS PRESS:—May I request you to be so good as to correct a slight error in your last week's "Press." I did not ascend Mt. Hood, but measured it trigonometrically from its base. It was my intention to make the ascent; but ascertaining that Col. Williamson, of the U. S. Engineers, was going to do it next August, and knowing that the measurements made under his direction would be thoroughly reliable, and would perhaps inspire more confidence than mine, gave up my idea of ascending the mountain, which indeed I was the more willing to do, as it was rather early in the season to make a thorough geological examination around the base. My observations were sufficient to settle the question whether the mountain is or is not lower than Shasta. It is much lower, nearly 2,000 feet, as I think Col. Williamson's observations will clearly demonstrate.

Yours truly, J. D. WHITNEY.

SUPERINTENDENT OF PUBLIC SCHOOLS.—We would call attention to the card of Superintendent Pelton, which will be found in another column, wherein he offers himself as an independent candidate for the position of Superintendent of Public Schools for another term of two years. We have always held that school matters should be kept aloof from politics, and we think Mr. Pelton will accomplish a good work if he succeeds in establishing a precedent for the election of our public school officers "without respect to political considerations." The opinion that such a policy should be adopted is fast gaining ground among the people, and it would appear especially appropriate that its initiation should be undertaken by one who has devoted the best energies of his life, and all his talent to the education of the youth of this city.

NEW AND EXTENSIVE WAREHOUSE.—The largest warehouse on the Pacific coast is under contract for construction at North Point, in this city. It will occupy an entire block, being bounded by Montgomery, Lombard, Sansome and Chestnut streets. The property is directly upon the water front, and the warehouse will be so constructed that vessels will be enabled to come directly up to it and discharge or take in grain from the very doors—thus saving a large item in cartage. It will be owned by Falkner, Bell & Co. and J. Friedlander, and will be in readiness to receive goods before the setting in of the fall rains. It is intended more particularly for the storage of grain.

in commercial greatness, by any other port on the entire Pacific coast.

If our merchants continue faithful to the high trust which has been committed to their nurture and charge, a future awaits them which will even eclipse in brilliancy the history of the past.

This magnificent Temple of Commerce, a fine illustration of which is herewith presented, is a structure fully in keeping with the present and future greatness of the city. It is an edifice of which we all may well feel proud of, as one that aptly adorns the commercial metropolis of the Pacific, and fitly illustrates its wealth and prosperity. It also affords a notable evidence of the liberality of our merchants, and of the

in the oldest commercial cities of Europe. It is well that such a noble and appropriate edifice should be reared in our midst, and it is most especially gratifying to know that it is controlled by an association worthy of such a home, and one which is doing so much for the benefit of the general industrial interests of the city and State—one whose influence tends in such a manner, to create and keep alive the high tone of feeling, fair dealing and friendly communication among merchants—ono which is so important and so powerful for good in a new and growing city like this.

The work of erecting this structure was commenced on the first of July, 1866; it was completed and formally opened on the

NUMBER EIGHT.

## MISTAKES OF INVENTORS.

In my previous letter I explained at some length, some few of the many tricks connected with the business of obtaining and selling patents. There are also other evils connected with the system, as at present practiced, to which I desire to call attention.

The first is a blunder into which inventors themselves are very apt to fall, and that is not taking more pains to ascertain before making their application, whether their invention is really new. A person gets an idea that a certain device or improvement upon some device that he is using would be a good thing; and without stopping to make any investigation to ascertain whether or not the same or a similar device is not already in existence, he rushes off to obtain a patent. After having expended considerable time, labor, and \$50 or \$60 in money, he finds that the thing is old, and has long been known, and perhaps used in some other portion of the country. A man should not conclude that because a thing is new to him, therefore it is so to all the world; and he should be careful how he wastes time and money upon a device until he has made a thorough examination to ascertain whether or not it is really new. The patent laws require not only that a person should be an original inventor of the thing, but also the first inventor. No class of inventors are so much deceived in this respect, as our agricultural friends, and this is accounted for by the fact that more than any other class of people, they stay at home and therefore see less of the world and of the improvements going on around them, than most other classes. Another reason is, that they do not read enough. Thousands of ideas relating to inventions and improved machines are daily spread broadcast through the land, which they never see, simply because they do not take the papers. No intelligent farmer should think of trying to live with less than four regular papers—first, his local paper and the best agricultural paper in his region, both of which are identified with, and working for his interests—and next, some metropolitan journal, like the *N. Y. Tribune*, to supply him and his family with the political and general news of the world—and last, but not least, some scientific paper to keep him posted as to the improvements of the day, especially if he is one who ever thinks of success as an inventor. The money wasted upon a single unsuccessful application for a patent, would pay the subscription on four such papers, for half a dozen years! Farmers—inventors—you cannot afford to do without them—and if you can, your children cannot. By all means take the papers—they will yield you a larger and more profitable return than any investment you ever made.

The means for obtaining information as to whether an invention is new, are three-fold—first, by reading the papers as above stated; second, by examining the Patent Office Reports, which are obtained gratuitously from your Member of Congress and Senators. In these reports all the patented inventions are annually illustrated and described. The rejected ones are not described in any publication, nor are they open to inspection to any one, even at the Patent Office, except to the employés and parties interested—apparently a very unreasonable and inconsistent provision and one that ought to be remedied with certain conditions. (It is proper, however, to guard against misapprehension, by stating that the models in all rejected cases are exposed to public view, after the case has been two years rejected.)

## EMPLOY HONEST AND COMPETENT AGENTS.

The last and best means of ascertaining whether an invention is really new, before making an application, is to employ some competent and honest agent, familiar with the business, to make a preliminary examination at the Patent Office. In nine cases out of ten this course will be successful, and very frequently by paying \$5 for this purpose, a party saves the agents and government fee of \$40, which would otherwise be lost. But here, as elsewhere, it is vital that an honest and competent agent be employed. I have now in mind an instance where a western inventor sent \$5 to an agent, requesting him to make a preliminary examination upon one of the simplest of devices, and in a very familiar class. He did so and reported it entirely new and patentable. The inventor made his application through that same agent—his and the government fee amounting to \$40, and was then rejected by the Examiner upon half a dozen references just like it, picked out of the first folio in the class to which it belonged—and thus the inventor lost his \$45, besides his time and labor, and got no patent, all because of entrusting his business with a careless, if not

dishonest or incompetent agent. And yet, I have no doubt, that agent had on his card, as recommendations, the names of at least a half dozen members of Congress! But of this hereafter.

Another error committed by some inventors is, insisting upon applying for a patent on a device, or a particular feature in some device, after their agent has informed them that it is not new or patentable. Such a course is not only absurd, but results in a waste of money and effort. I am aware how difficult it is for an inventor to believe that his invention is not different from and superior to all others—just as each mother believes her baby to be handsomer and smarter than all others! It is but human nature for us all to prefer the things of our own creation to all others, and as the baby is the mother's pet, so the inventor's particular device is his special pet; but he should remember that others look at it from a different stand point—that while his interest and partiality causes him to see in it all that is new and good, and nothing that is old or bad—while it looms up before his excited imagination, until it seems to shut out from his view, mentally eclipsing—all other things, others do not see it in that light. He should remember that at the office it must hear the thorough investigation and scrutiny of those who are not and cannot view with the partiality and favor with which the inventor himself views it.

It is simply foolish for an inventor to employ an agent whom he cannot trust—and it is equally foolish, when such an one is employed, not to trust him. The folios in the Patent Office are filled with rejected applications which would never have been made if the parties had taken pains to post themselves beforehand, or had employed a competent agent to make a preliminary examination, and been guided by his advice. So too, claims to devices "old as the hills" almost, are rejected every day at the office, and which claims were made only because the inventor would not believe his agent when told that it was old? In such cases he loses his case entirely, or pays the agent another fee for obtaining just what he might have had at first, had he chosen to have been guided by him. No one man has yet been created with mind sufficient to know or do all things, and the observation and experience of the world proves that a man always becomes most expert and successful in that business for which he is naturally best adapted, and to which he then devotes his whole mind and energies. Therefore when you need an agent, get one who understands his business, and then let him do your business in that particular line. To see the folly of any other course you have but to imagine yourself employing a lawyer, and then dictating to him how he shall frame his pleadings for court!—or a physician, and then yourself prescribing the medicines he shall use, while not even knowing the nature of your disease!

And this leads me to make another observation, to wit:—Be sure that you make your agent fully understand the nature and operation of your invention. Many are the failures from not attending sufficiently to this point. In the case of one of the most important and valuable inventions of the day, the inventor states in a pamphlet giving a history of his efforts and trials, that the first agent he employed having taken his model apart in order to make the necessary drawings, put it together wrong, and then made his application upon it in that way! Failing to get what he wanted, he then employed another agent, who, not discovering the error committed by his predecessor did the same thing! And he only succeeded after going to the Patent Office himself, at great expense and much trouble, and taking out several patents, and one or two re-issues in securing what was really his invention, and a very valuable one at that. In another instance a party had his case twice rejected upon good references, simply because not having made his agent understand his case, it was not so presented as to show at all the nature of his invention. After going there himself, employing another agent, who, having made his model, knew exactly what the patent was—and then obtaining a special order to have it again examined, he finally obtained the patent for what he wanted, and which has since proven to be of great value to the community, and worth thousands of dollars to himself. In still another instance, and in a device which consisted of but three pieces, the agent not getting the inventor's idea clearly, represented one of the parts upside down, and the patent issued with it in that manner, thereby rendering it entirely useless! And what is stranger still, the party finding that it did not work—in other words that his patent was valueless, made an application for a re-issue, in order to remedy the defect, and employed the same agent, who again made the same mistake!

In each of these cases the agents were the most experienced that practice at the office; and the whole difficulty arose from the fact that the inventors did not make their agents clearly understand their inventions. The inventor having dreamed over his invention by night and by day, each feature has become as "familiar as household words" to him, and he is too apt to take it for granted that because he understands it, therefore others ought to also. The cases I have instanced illustrate the danger and evils of proceeding upon such an assumption. Too much care cannot be used in this respect.

How to ascertain who are competent and honest agents is a much more difficult matter, unless there is one residing in your own locality, whom you may thus know personally; but this, from the nature of the business is not often the case.

In order to conduct the business successfully, an agent must be where he can have access to the office frequently, not only for the purpose of examining the references given, but also to examine the valuable library there, furnishing information on all subjects connected with the business, and which no private individual or library possesses.

Again, it is a great advantage for an agent to be able to have personal interviews with the Examiners, and thereby make explanations in relation to the points of a case, which it would be both difficult and tedious—if not sometimes absolutely impossible, to make by written correspondence. By being at hand, he can also make any required amendments at once, and thus hasten the final decision of the case. By being there, he can also attend in person, to argue cases before the board of Commissioners, on appeal. For these, and similar reasons, most agents reside at the Capital, or in large cities, from whence they frequently visit the office. In this, as in all other businesses, there have accumulated at the Capital, quite a number of agents, some of whom are neither competent nor honest. As a general thing these parties send out cards or circulars, having on them the names of Senators, Members, and other dignitaries, recommending them as competent, and worthy agents; while in fact, some of them cannot even write a sentence grammatically,—spell a dozen consecutive words correctly—and do not know the names of the simplest parts of the simplest mechanism! Others again are absolutely dishonest—their business consisting mainly of receiving the fees sent them, which like the money sent to "confidence" men in our large cities fails to elicit any reply! Both these latter classes, are generally composed of persons who know little or nothing of the business, and who have taken it up in lieu of any other means of getting a living, simply, because their customers, living at a distance, and therefore not likely to make their personal acquaintance, can thereby be the easier deceived and defrauded. In the majority of cases, they obtain the signatures of members and others, by "horing" them, until, to get rid of their importunity, they give their consent—or, through the influence of some family friend. Such cases are by no means rare.

Now for all this, there is but one sure and effective remedy! and that is, for Congress to provide by law, for the examination before a competent and thorough tribunal, of all persons desiring to act as agents; and forbidding any one to act as such until duly admitted by said tribune, the same as is now done in all courts throughout the country. This, if thoroughly enforced, would cut off all dishonest and incompetent agents, and would be of great benefit to one of the noblest and best class of citizens—the inventors of our land. All honest agents would heartily welcome such a law, for they, too, are made to suffer by the acts of the dishonest and incompetent. All that is necessary, is for the inventors of the country to petition Congress for the law, and they can have it. It would be a great benefit to the office, to honest agents, and to inventors. Then why not have it?—*W. C. Dodge, in Prairie Farmer.*

A LARGE POULTRY ESTABLISHMENT is about to be established in the immediate vicinity of New York City. Such establishments have never yet succeeded except in France. The present undertaking will test the practicability of such an enterprise in this country.

HEAVY OAK BARK.—The *California Farmer* acknowledges the receipt of a specimen of oak bark from Albert Smith, Esq., of Coppenopolis, which measures nearly five inches in thickness! This bark is from the ranch of Lafayette Bates, about four miles from Coppenopolis.

## Reese River Mines.

The following is from the Reese River Reveille of July 26th:

We give below the returns of mines in Lander county which have produced bullion during the quarter ending June 30th, as compiled from the books of the County Assessor. With the exception of those mines which have had less than a ton of ore worked (fifteen in number, which are omitted) the table is complete. The exhibit will be found very interesting, and is worthy of attentive examination and comparison with the returns of previous quarters:

The whole number of tons of ore reduced during the quarter was 1,438, which produced the sum of \$232,335.57. The average yield of the 1,438 tons was \$161.56 per ton—a result that fully maintains the character of Lander Hill, from which it was chiefly obtained, for yielding uniformly a high grade of ore. On comparing the present table with that of the previous quarter, notable fluctuations and uniformity will be observed. For instance, the North Star mine of the Manhattan Company produced during the last quarter 508 tons of ore, which averaged \$149.40 per ton, against 384 tons, averaging \$141.37, in the former quarter; the Florida produced 173 tons, which averaged \$206.10 per ton, against 101 tons, averaging \$351.96, of the former quarter; the Buel North Star produced 127 tons, which averaged \$163.63 per ton, against 31 tons of first-class ore, averaging \$182.56, and 16 tons of second-class ore, averaging \$51.52 per ton, of the former quarter; the Timoke produced 97 tons, which averaged \$241.49 per ton, against 100 tons, averaging \$276.59 per ton of the former quarter; the Fuller produced 14 tons, which averaged \$741.67 per ton, against 4 tons, averaging \$349.34 per ton, of the former quarter; and the Diana produced 37 tons, which averaged \$103.60 per ton, against 195 tons, averaging \$94.30 per ton, of the former quarter. The most marked fluctuation is that of the Great Eastern, which produced during the last quarter only 34 tons, which averaged \$70.91 per ton, against 137 tons, with the remarkable average of \$345.93, for the quarter ending 31st of March. Considerable exploration has been carried on in the Great Eastern during the last three months, the result of which we have not learned. Several mines, which produced bullion in the former quarter, are not included in the above table; and others again which were not mentioned then, appear in the present return. The most noticeable of the latter is the Gilligan mine of the Social and Steptoe Company, in Egan Cañon, which appears in the present table with the good product of 150 tons, averaging \$90 per ton, which is scarcely 60 per cent. of the silver contained in its peculiar ore. The returns of the last quarter are generally very encouraging.

A ONE IDEA MAN.—A man has recently died in Germany, whose sole idea for a lifetime has been to collect a specimen copy of every edition of "Don Quixote." There were found in the library of this bibliomaniac, 400 editions of the work in Spanish, 200 in English, 160 in French, 96 in Italian, 87 in Portuguese, 70 in German, 13 in Swedish, 8 in Polish, 6 in Danish, 5 in Latin, 4 in Greek and 4 in Russian—in all, 1,061 editions.

## Mechanical.

## Minute Mechanism.

There are numerous forms of manufactures of iron which are worth many times their weight in gold; but perhaps in no branch of mechanism is that cheapest of all the metals so much increased in value as in some of the more minute portions which go to make up the machinery of a watch. A gentleman who recently visited the Waltham (Mass.) watch manufactory, writes that he was shown a small vial, such as homoeopathic pills are usually put up in, but which was then filled with what appeared to be small grains of blue sand. On examination with a microscope, he found them to be minute but perfectly formed screws, made of the finest blue steel—so small that it required 300,000 of them to make one pound in weight! Little bits of steel were also shown, with points exquisitely polished, which required about 25,000 to the pound. These latter were valued at \$20,000 per pound; how high the former were valued, we are not told. Their value must be equal to that of the most precious of diamonds.

All these minute specimens of mechanism, as well as every other running portion of a watch, are made by machinery, and so accurately finished that though a thousand watches were taken to pieces, and their component parts mixed helter-skelter, the thousand watches would go together again as well as though every piece, in all that vast number, was elaborately fitted to its fellows. It may be interesting, in this connection, to state that watches and firearms were first made by machinery in this country, in such a manner that any part of one will fit its proper place in any other. In the manufactories of Europe, each watch, to this day, is carefully fitted, piece by piece, without any reference to its fitting in any other watch than the one for which it was especially made. The following is the description given by the writer above alluded to, of the process of the manufacture of the minute screws for the Waltham watches:

"What you see at a first glance, is a thin thread of steel, finer than the most delicate of pins, slowly pushing its way through a little hole in a machine, and being grasped by a tiny tool which runs around it, as if embracing it; and then, presto! change! out comes a knife and cuts off its head. All this is done so quickly that you have to wait and watch the operation, after you know what it is all about, before you can see the process I have described. The bits thus beheaded with a hug, look exactly like little grains of powder. But they are screws. You notice that when you take a microscope and examine them. They are complete—almost. Not quite, yet. A girl picks them up, one by one, with a dainty tool, and places them in rows, one in every hole in a flat piece of steel. This little plate, as soon as it is filled, is placed under another machine, and it would do any Irishman's soul good to see it work. It beats Doneybrook Fair "all hollow." I never had a more convincing proof of the superiority of mechanical over manual labor. For while a good hearty man with a stout bit of shillalah may break half a dozen heads of a day—with fair luck—this machine, without so much as saying "By yer lave," comes out of its hole, and runs along each row, quietly splitting the head of each one of them exactly in the center. And now the screw is made.

**A POWERFUL ENGINE.**—A locomotive has just been built for the Camden and Amboy railroad, which is about as powerful a machine of the kind as has ever been constructed. It is a ten-wheel engine, having six drivers four and a half feet in diameter. The cylinder is seventeen inches in diameter, with a stroke of twenty-four inches. It will be finished in a short time. It is intended that it shall have sufficient strength to draw 100 cars, laden with coal, in one train.

**IMPACT.**—With respect to the impact of projectiles, Howard Douglass has said: "No additional weight of projectile will increase the effect of its impact, the charge of powder remaining unchanged. The ignited powder is the primary force—not the shot."

## To Preserve Stakes and Posts.

Enquiries are often made for some simple and cheap manner of preserving fence posts and stakes from rotting when set in the ground. Of course, charring is a very good preventive, but very inconvenient to be done thoroughly, and after all, not very effective, as the moisture penetrates the indestructible surface, and soon rots the inside. The following is perhaps as convenient a method as any which can be fully relied upon. It is especially convenient in gardens and nurseries, where great numbers of stakes and other wooden supports are employed, which are driven into the ground, and which, unless in some way protected, soon require renewal:

Take one pound of blue vitriol (sulphate of copper) and dissolve in four quarts of boiling water; pour the solution into a metal or kayed wooden vessel of convenient dimensions and add to it fifteen gallons of cold water. Let the ends of the stakes or posts be placed in this liquid as deep as you propose to put them in the ground, and allow them to stand four or five days for small supports for plants, or ten days for 6-inch posts. Shingles may be made almost indestructible by an immersion of three days.

An iron vessel is preferable to any other, for the reason that this liquid, unlike most others, shrinks instead of expands wood. If wood is used, it must be a kayed vessel, so that the keys can be driven up—if a barrel, the hoops must be occasionally driven, or you will lose your solution.

This is, in fact, kyanizing; but in a simple manner, within the reach of all, and so cheap, that when timber and labor is as expensive as it is in California, the wonder is that something of the kind is not in more general use. Stakes for supporting vines, prepared in this manner, have been found as sound below as above ground, after being in constant use for twelve years.

In this connection, it may be well to recall a statement which we saw given in the *Genesee Farmer*, some eight or ten years ago, and which we do not recollect to have seen contradicted by the experience of any one since. If it is correct, it should be known and practiced by every person who ever builds a fence, and does not see fit to employ any other means for preserving his fence posts. The fact was communicated by a correspondent of the *Farmer*, as follows:

About thirty years ago, to test the thing, I split two bar posts, side by side, out of a chestnut log. They were eight feet long, eight inches wide, and three inches thick. One I set butt down, the other top down. At the end of ten years the one set butt down was rotted off, and I reset it in the same hole. At the end of six years it was rotted off again, and I put in a new one. The other lasted four years longer, when it got split in two, and I took it out, and it was about two-thirds rotted off. Sixteen years ago I set six bar posts, all split out of the butt end of the same white oak log. One pair I set butt down. Another pair, one butt down and the other top down; the others top down. Four years ago those set butt down were all rotted off, and had to be replaced by new ones. This summer I had occasion to reset those that were top down. I found them all sound enough to reset. My experiments have convinced me that the best way is to set them top down.

**INCREASE OF POPULATION.**—Some one has remarked that the generality of people never stop to think how fast America is being filled up by immigration. The *Missouri Republican* presents the subject in the following practical form. It says:

Half a million of Europeans will have immigrated to this country before the end of the year, and more, probably, will come next year. In twenty-four months a population in numbers equal to that of Missouri reaches our shores; in twice that time they could fill a State with a population twice as large as that of Illinois, and (their descendants included) an immigration of six years is more than sufficient to fill the United States with a population as great in number as that which our country had when it declared its independence.

The food crisis at the South has passed, and the cry of distress is being hushed by the in-gathering of early crops.

## Scientific Miscellany.

Snow is vapor, upheld in clouds and freezing in its descent. A very cold current of air coming in contact with a warmer current highly charged with vapor, occasions the precipitation of that vapor in the form of snow. In very cold latitudes, artificial snow-storms are sometimes formed in large rooms. A case occurred last winter in a ball room at St. Petersburg, where a cool current of air was suddenly let into the room by opening an upper window, for ventilation; the result was that the moisture of the room was precipitated upon the floor and the dresses of the fair dancers in the form of snow. The whiteness of snow is due to the multiplicity of the minute particles, loosely held together, which form a "flake." Hail, and all crystallized ice, is transparent and solid. Pulverized ice, or the ice particles separated, is as white as snow. Snow will sometimes evaporate, even when the general atmosphere is above the freezing point—hence its frequent perceptible diminution without rain or any noticeable thaw, and when the thermometer in the immediate vicinity is below the freezing point. Such evaporation produces the "rimo frost" frequently seen on the windward side of twigs and weeds when there has been no rain. "Hoar frost" is frozen dew.

**AUTOGRAPHIC RECORD OF SOUND.**—Strange as it may seem, it is nevertheless a fact, that sounds may be made to record themselves, whether they be the sounds of musical instruments, or sounds emitted by the human vocal organs in talking or speaking. The manner of accomplishing this was discovered by an Englishman—Mr. M. L. Scott. The record is made upon paper, and the mark produced by a particular note is invariably the same. When a person speaks, the tone of voice is faithfully recorded; but as yet the apparatus has not been made sufficiently delicate and rapid in working as to record a spoken sentence; although Mr. Scott is very sanguine that, in the course of time, he will so far improve his apparatus as to make it capable of printing an entire speech as fast as it drops from the lips of the speaker. Prof. Whetstone, of England, and the Abbe Moigno, of Paris, have both taken quite an active interest in the discovery.

THE "ARCUS SENILIS" is the scientific name of a ring or bow or segment of a circle which shows itself on the edge of the corner or dark part of the eye of a person advanced in age. *Arcus senilis* is the Latin of "old man's bow." This appearance is a fatty degeneration, and a never-failing symptom of bad health or a failing constitution. Mr. Canton, President of the Medical Society of London, has written quite a volume upon the *arcus senilis*. It is proper that its appearance should be watched for, and when observed it should be regarded as a symptom of decay and a notification from Nature that the person should pay more attention to his health. If attended to in time, says Mr. Canton, the cause of its appearance may be removed, and perhaps many years of life added to the individual.

**IMPROVED REFLECTING TELESCOPE.**—Silvering glass by Liebig's process has recently met with a most successful and practical application by the well known optician, Mr. John Browning, in its use for reflecting telescopes. It is said that the instruments made with this process of silvering, compared with ordinary reflectors, possess the following advantages: They need be only half the length, are of greater dividing power, are quite free from chromatic aberrations, more convenient in position to the observer, and are furnished at one-fifth the cost. The silver surface, if tarnished, may be readily brightened by being rubbed with a piece of soft buckskin, or, if seriously injured, can be replaced at a trifling expense.

THE LIGHT OF FIRE-FLIES.—The commonly received opinion as to the source of light emitted by fire-flies is, that it is due to the slow combustion of phosphorus. An English chemist, Mr. Henpath, however, has carefully examined into this matter, and failed to find, on the application of the most delicate test, the smallest trace of phosphorus in the composition of these interesting and curious insects. His opinion is that their luminosity is produced by the burning of a peculiar compound of carbon and hydrogen, in a special gland exposed to view.

**ARTIFICIAL MEERSCHAUM** is now prepared for commerce, according to the *Chemical News*, by mixing 100 parts of silicate of soda, at 35°, with 60 parts of carbonate of magnesia with 80 parts of native meerschaum or pure alumina—the mixture to be carefully pulverized, finely sifted, boiled with water, and placed in porous molds. We presume the "silicate of soda at 35°" means silicate which, when in solution, would stand at 35° Beanné.

**ANIMAL ELECTRICITY.**—In most animals with a soft fur, sparks may be produced by rubbing it, especially in dry weather. This is familiar to most persons in the case of the domestic cat; but the electricity thus produced seems occasionally to accumulate in the animal, as in the Leyden jar, so as to produce a shock. If a cat be taken into the lap, in dry weather, and the left hand be applied to the breast, while with the right the back is stroked, at first only a few sparks are obtained from the hair; but after continuing to stroke for some time a sharp shock is received, which is often felt above the wrists of both the arms. The animal itself experiences the shock, for it runs off with terror, and will seldom submit itself to a second experiment.

**PLANT PAINTING.**—Very pretty pictures of plants may be obtained by observing the following directions: "Take half a sheet of fine-wove paper and cover the surface with sweet oil; after it has stood a minute or two, rub off the superficial oil, and hang the paper in the air; when sufficiently dry, move the paper slowly over the flames of a candle or lamp until it is perfectly black; lay the plant or leaf thereon, place a piece of clean paper over, and rub it equally with the finger about half a minute; take up the plant and place it on the paper or scrap-book where it is desired to have the impression; cover it with a piece of blotting paper, and on repeating the rubbing, the representation of the plant will appear.

**TRANSIT OF VENUS.**—The transit of Venus over the sun's disc, which last took place on the 3d of June, 1769, will again happen on the 8th of December, 1874, and is already engaging the thoughts of astronomers. It affords a direct observation of the planet's node, or points where its orbit cuts the elliptic, an element which is of great value for the correction of astronomical tables; but it is chiefly important for the determination of the sun's parallax (or angle under which an observer, situated in the center of the sun, might see the earth's radius).

THE RUSSIAN OBSERVATORY at Poulkovo is said to be the finest in the world. It possesses the largest refractor in the world, meridian circles, vertical circles, clocks sunk deep in the earth to preserve their rate, masses of masonry, some of them thirty feet below the floor and forty feet long by fifteen broad, to support the instruments, preservation of a constant temperature through a Russian summer and winter—everything that man can think of to render observation perfect is here to be found, and now for five and twenty years has been employed with unvaried success. The celebrated Strove is at the head of this establishment.

**STRUCTURE OF GRANITE.**—Upon a close microscopic examination of granite, ground and polished so thin as to be transparent, and then cemented with Canada balsam between two glass plates, Mr. Sorby has discovered that this rock contains an immense number of cavities, holding water and saline solutions, which must, therefore, have been in the liquid state when the rock was in process of formation. It must therefore be concluded that granite is not simply an igneous rock, but that it has been formed by the joint action of fire and water.

## The Paris Exposition.

The Sacramento *Bea*, of July 30th, contains a letter from its Paris correspondent, from which we quote a few paragraphs:

## CALIFORNIA WINES.

"We have labored under disadvantages in bringing American wines before the jurors. The United States was not allowed a juror to speak for them, nor would the French jurors willingly hear a word, but treated the whole matter of wine-making in any other than a European country as only an experiment. Another disadvantage: the wines on arrival here were arranged on shelves, the bottles all standing corks up, and within six feet of three large sheet-iron chimneys from the kitchen of the grand restaurant directly beneath. In this position from their first arrival they have been exposed to a continued heat, varying from seventy to ninety degrees. As a consequence, when we first examined them (June 2d) the corks were flying from the bottles, or bottles bursting at the rate of three or four a day; and in this condition Commissioner Beckwith allowed California wines to pass to the test of French jurors. Of the unfairness of the jurors in testing the wines, a single illustration will suffice: from each of the five exhibitors a single bottle was taken, without reference to the age of the wine, some of it being two years, some ten years old."

## CALIFORNIA HOPS.

"Resting upon a table in the midst of other American products, is a single bale of California hops. It bears no label or mark except this: 'F. Scherr, San Francisco, California.'" \* \* "Not a day passes that we do not see from one to five paper bags, each holding from a pint to a quart, filled with these hops, for the purpose of testing their quality; and gentlemen who have taken them one day come with two or three others the next, all of whom take in their turn the accustomed quantity for renewed trial, and thus far all are surprised that the quality fully equals their fine appearance. "Now, whoever the person may be that sends this bale of hops to the Exposition, we can inform him that though he will lose his hops, he will do more for the agricultural interests of California, by increasing the foreign demand for California hops, than many others will do who came to the Exposition, making far greater pretensions."

## COMMISSIONER BECKWITH.

"Long and deep are the mutterings heard on every side in relation to the action, or, rather, the imbecility of the head Commissioner for the United States. Not only does he seem totally incompetent to the trust confided to him, but he seems not to recognize the necessity of treating his own countrymen with the courtesy due even to strangers. All Americans whom we have met, including Marshal P. Wilder of Boston, W. J. Flagg of Cincinnati, both Commissioners of the United States to the Exposition, and Dr. Thompson, who represents the State Agricultural Society of New York, are loud in their denunciation of the inefficiency and want of gentlemanly courtesy of Commissioner Beckwith."

## EXHIBITORS AND AWARDS.

The total number of exhibitors at the Paris Exposition is about 60,000; the total number of awards, 23,000—60 grand prizes, including several large sums of money; 9,000 gold medals; 3,600 silver medals; 5,000 bronze medals and 9,000 "honorable mentions." The American Exhibitors obtained more than their portion of awards, in proportion to the number of exhibitors; our countrymen having obtained 262 awards for 524 exhibitors—1 in 2; while European exhibitors obtained but 23,660 awards for 59,476 exhibitors, or 1 in 2.54. The American awards were made up as follows: 4 grand prizes, 14 gold medals, 59 silver medals, and 89 bronze medals. Two silver medals were awarded to Californians—to Prof. W. P. Blake and Dr. Pigné-Dupuytren, of this city, each for collections of California minerals; and a bronze medal to the Mission Woolen Mills of this city.

The decoration of the "Legion of Honor" has been conferred on no less than nine Americans—N. M. Beckwith, U. S. Commissioner, has been created an officer of the order; and Messrs. Charles Perkins, Lawrence Smith, Samuel B. Ruggles, Goodwin Birney, Elias Howo, Frank Chickering, Mr. Kennedy and Mr. Mulet, have been made knights.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**A HAND SPINNING MACHINE.**—Mrs. Huln, a lady living near Indianapolis, is the inventor of an improved hand spinning machine. It is made with any number of spindles, from three to twelve, and a farmer's wife or daughter can run a machine with six spindles with more ease than the old fashioned wheel with its single spindle. Mrs. Huln whittled out the model with her own hands.

This looks like reviving the old-time industry of our grandmothers, when more woolen and less street yarn was spun than at the present time. The above invention is most opportune, and it is especially appropriate that it should have been the brain and handiwork of a lady. It would be well for the world if it could come into as general use as the old-fashioned spinning wheel, which modern invention has so effectually put out of sight.

**CONDON'S IMPROVED CAR COUPLING.**—Joseph Condon, of Meadow Lake, has invented an arrangement for coupling cars; by which contrivance one car can be fastened to another while the train is in motion, and with perfect safety—a very decided improvement over the present method of attaching railroad cars, and would prevent many accidents of a serious character.

**WARREN'S IMPROVED WAGON MAKING MACHINE.**—Mr. W. T. Warren, near Virginia City, Nevada, has invented a new machine, for the use of wagon-makers, which is thus described in the *Virginia Tresspass*: It is built in the shape of the letter L, running by crank motion, for use in a wagon-maker's shop, and is so arranged that a person can bore any sized holes desirable in the hardest timber and bore them perfectly straight; it tenons spokes of wheels; has benches arranged so as to change to a turning lathe or a circular saw, in a half minute's time; and is all and all a most economical arrangement for use in a wagon maker's shop.

## PATENTS RECENTLY ISSUED.

66,217.—MITER BOX.—E. C. Cheek, Placerville, Cal.:

I claim, 1st, An adjustable miter box composed of a bed or frame, A, to which are secured the swinging-arm, B, the permanent stops, H, H, and the movable stop, I, all constructed and operating substantially as described and for the purpose set forth.

2d, The movable stop, I, to hold the work close to the saw-cut and on either side of the same, and operating substantially as set forth.

66,327.—SUSPENSION BRIDGE.—A. S. Halliday, San Francisco, Cal.:

I claim, 1st, The cables, C, C, in combination with the suspension-rods, D, D, and girders, E, E, all made and operating substantially as herein specified and described, and the rods, D, being made adjustable, as set forth.

2d, The combination of the adjustable cables, C, C, posts, A, rods, D, girders, E, and adjustable braces, G, with each other and with the flooring, F, all being made substantially as herein specified and described.

66,382.—WATER WHEEL.—Thomas Pattinson, Little York, Cal.:

I claim the construction and arrangement in the case, C, of the water wheel, A, provided with the buckets, c, whose under sides, d, are beveled, the penstock, E, having supply pipe or tube, F, and provided with the gate, H, operated by the screw, I, the removable discharge-tube, G, attached to its under side, whereby the water under static pressure is delivered in a perpendicular column upon the buckets, c, substantially as herein shown and described.

**OIL CAKE.**—It is gratifying to perceive that our dairy and stock men, generally, are beginning to appreciate the valuable food for stock, which has recently been introduced into this market in large quantities, in the shape of oil cake from the Pacific Oil Works, in this city. The great Millbrae Dairy, near the Seventeen Mile House, are feeding it to their cows. Oil cake sells for \$50 per ton in Liverpool and for \$40 in New York; and yet the dairymen near this city, allow it to be shipped from hence, when it is offered to them at the low price of \$30.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,  
AUGUST 3, 1867.

## CITY STOCKS.

We have to report continued apathy in this class of investments, the transactions for the past week having been comparatively light. One hundred shares Fireman's Fund Insurance Company realized 93  $\frac{1}{2}$  cent.; 50 shares National Insurance Co., \$67 per share; 20 shares Spring Valley Water Co., \$66.75; and California Steam Navigation Co. opened at 71  $\frac{1}{2}$ @71  $\frac{1}{2}$  cent., then sold at 70  $\frac{1}{2}$  cent., and at the close is offered at 70  $\frac{1}{2}$  cent. The San Francisco Gas Co. paid its usual dividend of  $\frac{1}{2}$  cent. per month on its capital stock on the 1st inst. We quote this stock at \$64 bid and \$64.50 asked.

The sales in the Stock and Exchange Board in the month of July for the past four years compare as follows:

July, 1864.....	\$1,907,557	July, 1866.....	\$1,553,374
July, 1865.....	4,721,193	July, 1867.....	6,822,200

## MINING SHARE MARKET.

The Mining Share Market has been seriously depressed during the period under review, a demoralizing influence having manifested itself in nearly every share on the list. This sympathetic feeling has produced a very changeable market, and has, for the moment, materially lessened the volume of transactions. Speculators hesitate under the depression, and legitimate purchasers are not so numerous; however, as regards the yield of the different claims on the Comstock Lode, we are of the opinion that the aggregate receipts of bullion for the month of July will not be less than the amount received in June.

**SAVAGE**—has been in the market to a limited extent during the past week, but has been well maintained at an advance, opening at \$4,375@4,400, then selling at \$4,500, and closing yesterday at \$4,475. We are informed that on the seventh level, north mine, at the north end of the breasts, the ore has widened out to nearly sixty feet, being of a good quality and with more first-class ore in it than has yet been found in this claim. Neither the middle nor south mines on this level show any change. The south drift from the third station is now in better ore than was at any time obtained from points above in this part of the mine. On the 27th ult., the drift from the fourth station was fifty feet from the shaft, and rapid progress continues to be made. Work in sinking the shaft will be resumed in the course of a week. During the week ending July 27th, 2,339 tons of ore were taken from the mine, showing an approximate yield of \$95,234, or \$40.41 to the ton. Of this amount, 22 tons were first-class, 307 tons second-class, and 2,010 tons third-class. At the meeting of stockholders, on the 30th ult., it was decided to increase the capital stock to \$3,500,000, and the shares to 16,000 of \$200 each. The new stock will be ready for exchange on next Monday or Tuesday.

**HALE & NORCROSS**—remains out of the market and in strong hands. At the close, this stock is offered at \$3,000. The aggregate returns of bullion for the month of July will be considerably more than they were in June, showing an average yield of about \$41 to the ton. We learn of no material change in the mine. The shaft was 566 feet in depth on the 27th inst., a gain of eight feet in five days.

**CROWN POINT**—sold at exceedingly fluctuating rates during the period under review, opening at \$1,350@1,400, falling to \$1,020, rising to \$1,375, receding to \$1,050, and closing yesterday at \$1,060. The telegraphic report of the 31st July—that good ore had been found in the face of the drift on the 600-foot level, 125 feet from the shaft—was contradicted by a dispatch of the next day, saying that they were running in quartz and encountered very little pay ore. The deliveries of ore during the week ending July 26th compare as follows with the previous week: 617  $\frac{1}{2}$  tons, showing an approximate value of \$21,826.61, or \$35.33 per ton, against 589  $\frac{1}{2}$  tons, valued at \$20,223.34, for the week ending July 19th. Of

the former amount, 418  $\frac{1}{2}$  tons were extracted from the 400-foot level, and 199  $\frac{1}{2}$  tons from the 500-foot level.

**YELLOW JACKET**—has been quite active, manifesting the same unsteadiness as most other descriptions of mining shares, advancing from \$925 to \$1,080, receding to \$980, then selling at \$1,145, buyer 3, dropping to \$1,050, and closing at \$1,050. It is said that the general appearance of this mine is favorable, both in the north and south mines. From the report of this company for the fiscal year ending June 30th, 1867, we obtain the following statement of the receipts and expenditures:

Receipts.	
Balance at credit of Company June 30, 1866.....	\$142,815 33
Bullion proceeds.....	2,676,214 47
Morgan Mill, net profits.....	75,203 05
Ore sold.....	1,243 19
Other receipts.....	9,132 29
Total.....	\$2,904,608 38
Disbursements.	
Dividends paid, Nos. 4 to 12 incl' ve.....	\$900,000 00
Crushing ores at outside mills.....	435,005 26
Wine labor account.....	425,533 62
Crushing ores at company's mills.....	354,989 48
Legal expenses.....	67,503 20
Assay fees, discount and Federal tax on bullion.....	100,832 03
Other expenses.....	305,928 26
Total.....	2,783,811 84

Balance over all liabilities June 30, 1867..... \$116,086 54

The ore reduced during the year amounted to 84,340 tons, showing an average yield of \$31.73 to the ton.

**GOULD & CURRY**—has been well maintained since our last reference, selling within a range of \$720@690, and at the close realizing \$690. Nothing of importance has come to our knowledge regarding this claim.

**KENTUCK**—rose from \$385 to \$397.50, declined to \$370, rallied to \$398.50, receded to \$345, and closed yesterday at \$360. We have it from good authority that a dividend of \$40 per share will be paid this month.

**CHOLLAR POTOSI**—has been less active, declining from \$447.50 to \$415, and closing at \$421. The second Santa Fé level has been opened through the center of the body of ore some 160 feet, averaging sixty feet in width, and producing a much larger quantity of ore than was anticipated. The west drift on the third level from the new shaft, which is now in 38  $\frac{1}{2}$  feet, shows no change since our last report. The shipments of ore from July 19th to 25th amounted to 2,210  $\frac{1}{2}$  tons; previous week, 2,318 tons. The ore "slip" of July 29th shows that nine different mills were supplied with ore on that day.

**IMPERIAL**—has been well maintained within a range of \$210@200, closing yesterday at \$200.

**OVERMAN**—has been in the market to a large extent, over 2,000 shares changing hands at greatly declining rates, dropping from \$205 to \$100, and closing at \$106. Since the 24th ult., the receipts of bullion amounted to \$9,500, making \$51,558 from June 6th to date. It is reported that the mine is not looking as well as it did some time ago, the ore being more mixed and requiring greater care in assorting.

**EMPIRE**—has continued to be well maintained, selling at \$180@185.... **OPHIR** declined from \$150 to \$105, and closed at \$115. Preliminary steps have been taken relative to the sinking of a new shaft. An assessment of \$3 per share (\$36 per foot) was levied on the 29th ult.

**ALPHA**—A few feet changed hands at \$440@425.... **GOLD HILL QUARTZ** sold within a range of \$175@155. The receipts of bullion in July will fall short of the yield in June.... **BELCHER** sold at \$280@265.... **CONFIDENCE** is not in much request, selling at \$57.50@60.

**SIERRA NEVADA**—has been quite active, some 400 shares changing hands at \$18@25, closing at \$24. An assessment of \$10 per share was levied on the 26th ult.... **BULLION** declined from \$28 to \$19, and closed yesterday at \$19.... **DANEY** realized \$23.... **JUSTIS AND INDEPENDENT**, \$10@6.... **SEREGATED BELCHER**, \$11@7.

The aggregate sales of stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,337,524.

**GRAIN RECEIPTS.**—The new grain crop is beginning to come forward in large quantities. Between 500 and 600 tons were shipped from Stockton last week, and, according to the *Independent*, wheat is being piled up on the new levee, as fast as room is made by the construction of that work. There will soon be as large a quantity accumulated in that city as at any time during last summer. Similar reports reach us from Sacramento. The great grain flow is now fairly under way, and the store houses of this city will soon be filled to overflowing with the accumulation from all parts of the State, awaiting shipments to the East and foreign ports.

Foundry and Machine Work.

FULTON FOUNDRY—REMOVAL.—The rapidly increasing business of this establishment has rendered it necessary that the proprietors, Messrs. Hinckley & Co., should remove their works to a location where more room and better conveniences can be had for carrying on their business.

The agency for Palmer's Artificial Leg has been removed from 629 Washington street to 218 Montgomery street, at which place Mr. Jewett will be prepared to supply the unfortunate.

INCREASE OF CAPITAL STOCK.—The stockholders of the Gold Quarry Co. held a meeting on the 29th ult., to take into consideration the increase of the capital stock from \$600,000 to \$2,400,000.

THE STAR SPANGLED BANNER MINE, located some three miles from Nevada City, is now being vigorously and successfully worked. Recently a new and fine development of free gold has been made in the lode in the last, 220-foot, level.

THE OREGON IRON WORKS, of Portland, which were recently destroyed by fire, are soon to be put into operation again. The Directors have purchased the old penitentiary building, at a cost of \$6,000, and intend to have their machinery in it and to work before the expiration of the present month of August.

THE DOWNVILLE MESSENGER.—This interior journal is one of the oldest, as it is one of the oldest newspapers in the State, and enjoys a circulation double at least that of any other within a radius of sixty miles.

MAXIMILLIAN is a name which, just now, occupies a large share of the world's attention. The signification of the name may be of interest to some.

NITRATE OF SILVER.—There are few things more essential to the daguerrean artist than a pure article of nitrate of silver; and yet it is a difficult thing to find it in that condition.

ADDITIONAL FROM ARIZONA.—The San Bernardino Guardian of July 27th, says that the Wickenburg mill worked 21 days in June, and turned out \$27,000.

AMUSEMENT WITHOUT TEMPTATION.—Parents will find Woodward's Gardens free from the temptations too often presented at public places of resort; while the gymnasium, the birds and animals, and the meandering walks around the trees, flowers and shrubbery of the ground, cannot fail to delight both parents and children.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Table with columns: NAME, LOCATION, AMOUNT, AND DAY DELIVERED, DAY OF SALE. Lists various mining companies and their share details.

\*Those marked with an asterisk (\*) are advertised in this journal.

Latest Stock Prices Bid and Asked.

Table with columns: MISCELLANEOUS STOCKS, RAILROADS, BANKING INSTITUTIONS, INSURANCE COMPANIES, MINING STOCKS—WASHOE DISTRICT. Lists various stocks and their prices.

San Francisco Market Rates.

Table with columns: Wholesale Prices, Groceries, etc. Lists various market goods and their prices.

Table with columns: Retail Prices. Lists various food items and their prices.

San Francisco Metal Market.

Table with columns: Prices for Invoices, Jobbing prices rule from ten to fifteen per cent. higher than the following quotations. Lists various metal prices.

ESTABLISHED [MAY, 1860.]

VOLUME FIFTEEN

Mining and Scientific Press,

COMMENCING JULY, 1867. DEWEY & CO., Publishers.

Issued every Saturday, at our Book and Job Printing Office, 505 Clay street, corner of Sansome, San Francisco.

THE MINING AND SCIENTIFIC PRESS is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal on this coast.

DEWEY & CO., Proprietors, Mining and Scientific Press Patent Agency, Newspaper, Book and Job Printing Office, 505 Clay street, San Francisco.

MINING AND SCIENTIFIC PRESS.

Terms of Advertising and Subscription. Miscellaneous Advertisements.

One week, per square, in advance \$1 50. One month, per square, in advance 3 00.

Advertisements of great length, or of special character, inserted by contract on the most favorable terms.

Mining Advertisements. If paid in advance. Notices of Meetings, per square, three weeks, \$3 50.

Notices of Meetings, per square, four weeks, 4 00. Assessment Notices, of ordinary length, four 7 00.

Assessment Notices, of more than usual length, four weeks, for each additional square, 4 00.

Delinquent Sales, per square, two weeks, 2 50. Delinquent Sales, per square, three weeks, 3 50.

Postponements, per square, one week, 1 50. Ships of Advertisements printed, for meetings at a reduced rate, per hundred, 1 00.

Advertising law blanks, circulars, and advice, Free. One copy, one year, by mail, in advance, \$5 00.

One copy, six months, by mail, in advance, 3 00. One copy, one year, by express, 6 50.

One copy, six months, by express, 3 50. Five copies, one year, by mail, in advance, 20 00.

By city carriers, per month, 50. Single copies, 15. Monthly Series (or parts) one year, by mail, 5 50.

Monthly Series, per monthly copy, 65. THE CIRCULATION of the Press, already extensive, is rapidly increasing, and substantial tradesmen who can profit by widely disseminating information of their business amongst the most influential and industrial classes of the Pacific States and Territories will find no more effective or economical medium for advertising.

DEWEY & CO., Proprietors, Patent Agency and Job Printing Office, 505 Clay street, San Francisco. [Jan 1867.]

NEW INCORPORATIONS.—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

CO-OPERATIVE UNION.—San Francisco, July 25th. Capital stock, \$50,000; 2,500 shares, \$20 each. Trustees: Henry F. Williams, B. H. Freeman, C. S. Hobbs, Wm. McKibbin and Gardner Elliott.

GOLDEN HOMESTEAD ASSOCIATION.—San Francisco, July 26th. Capital stock, \$45,500, 91 shares of \$500 each. Trustees: Aaron Holmes, Wm. Monahan, J. M. Parker, Isaac Wilson, James Atkinson, John Regan and Thomas Reynolds.

American and Foreign Patents.—Letters Patent for Inventors can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency.

We offer applications reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the *Miner* of July 27th: The workmen in the Mowyer tunnel struck quartz again this week. The vein is small but of good character.

The Mountain Co. No. 1, are still running in soft rock and making fine headway.

The Rippon Co., owning the old Mammoth ground at Silver Mountain, resumed operations.

Prospects in the Tarshish are encouraging.

## Amador County.

From the *Ledger*, July 27th: A recent run of 150 tons of rock from the Kennedy mine, worked at the Atelison mill, averaged about \$30 per ton. This was not as good as the last clean up, but pretty good, considering the size of the vein.

## Calaveras County.

From the *Chronicle*, July 27th: Henry Seeman, of Independence Flat, sold one-half of his claim, last week, for \$1,600. Mr. Seeman has been engaged for a number of years past, in cutting a ground sluice, through solid bedrock, and has just got his claim in a condition to work.

Lamphear & Co. are putting pumps into their claim.

Fairview correspondent of same, dated July 15th: The Wild Goose claim at Douglas Flat, struck the blue lead on Thursday last, the 11th inst.; pay dirt abundant and prospects two bits to the pan. The influence of the strike is felt already; it has given backbone to old claims and induced the location of new ones. Everybody is jubilant and predict a speedy return to the activity and prosperity of olden times. A new era is about to dawn. Hundreds of claims in Mariposa, Tuolumne and Calaveras, will be visited and reported upon this summer, for even San Francisco capitalists are sending agents to examine, with a view to purchasing.

## Colusa County.

From the *Sun*, July 27th: We learn that the copper smelting works of the Liou Co. have been completed, and that 500 lbs. of copper was run through this week.

## El Dorado County.

*Courier*, July 27th: We were shown two or three very rich pieces of rock from the State of Maine ledge on Thursday last. The ledge is located at Henry's Diggings, and owned by Hoffman, Foster & Co. They have a tunnel in 90 ft., which strikes the ledge at a depth of 30 ft. The company have erected a mill, and will commence crushing next week. A short time since Jacob Grubler, of Sacramento, purchased one-half of it for \$10,000.

Correspondence of the *Democrat*, July 23d: Good rock is coming out of the drifts from the 90 ft. shaft in the Epley claim. About 100 tons of rich ore has been taken out of this mine and piled up for crushing as soon as a mill is erected. From 30 or 40 tons of this ore crushed at the Harmon mill, sufficient was realized to cover within \$200 the entire expense of sinking the shaft and working the claim. In the Muller ledge, three miles south of Placerville, a tunnel 210 ft. in length run into the hill from Scott Ravine, strikes the ledge at the depth of 80 ft. At the point struck it is 18 ft. in width, and its average width as far as developed, cannot be less than 15 ft. From about two lbs. of rock crushed in a mortar I saw a prospect of not less than \$1.50. A shaft has been sunk from the surface 30 ft. in depth. A mill is being erected, which the proprietors think will be in running order in 30 days. On the Lone Star ledge, a shaft has been sunk 15 ft. The lode is so far only six or eight in. wide, but is rich. The Dangerfield & Elliott claim has a 3½ foot ledge. The shaft is 50 ft.

## Inyo County.

The Gold Hill (Nev.) *News* says: Mr. C. H. Duval, of this city, who some months since went to Lone Pine Dist., Cerro Gordo mines, not far from the fabulously rich Kearsarge, returned last evening. He brought back 46 lbs. of bullion, taken from claims located by himself. The bullion was extracted by smelting.

## Nevada County.

From the *Transcript*, July 25th: Mull, Evans & Co., at Buckeye Hill, Bridgeport township, after a run of a month, cleaned up \$22,000. This is about an average yield for these claims.

Same of 26th: Flash's quartz mill at Boston Ravine, which has been idle for several years, started up yesterday.

27th: We saw a lump of gold from Binsley & Co's claims, Kentucky Flat, yesterday, which weighed \$56. It was found a day or

two ago. These specimens are getting quite common in these claims.

31st: A Mr. Tew has taken hold of the old Osceola ledge, near Rough and Ready. His incline is already 50 ft. deep.

Weight & Co., on Columbia Hill, cleaned up after the last run of 13 days, \$7,150 in gold. They work 15 hands and use about 800 in. of water per day. Pickel & Co. and J. Woods & Co., working adjoining claims, are doing equally well. Nichols & Woodward, on Kennebec Hill, are also doing first rate, on the surface. Columbia Hill is located on one side of Spring Creek and Kennebec Hill on the other. On these ranges the gravel is now being washed to the depth of from 80 to 100 ft. A company is now being organized for the purpose of consolidating the interests of the two hills, and opening an outlet to Spring Creek for working the ground to a much greater depth.

*Gazette*, July 25th: The crushing of rock at the Pennsylvania mill, cleaned up on Monday last, yielded some \$50 a ton.

30th: At Eureka, the last run of the Black and Young mill, on rock from their ledge, yielded better than anticipated. A hundred tons of rock from the Bramberry ledge, lately crushed, also yielded well and the ledge is some three ft. in width. The owners of the Powell and Veatch ledge have all the machinery on the ground for their mill, the work on which is progressing rapidly.

Grass Valley *Union*, July 26th: We have encouraging news from Yon Bet. The cement claims of Necce & West, Collins & Son, Mallory, Brown and Hydelauf, at Yon Bet, are paying well; this being the first time in the history of Yon Bet that all these claims were paying at the same time. The old Cozzens & Garber claim, on Missouri Cañon, is now being worked with favorable indications.

The *National* says immensely rich rock is now being taken from the bottom of the shaft in the old Empire Co's works at Ophir Hill. The new shaft is down 580 ft., being 90 ft. deeper than the lowest level on the mine.

EXCELSIOR.—From the Meadow Lake *Sun* of July 27th: The mill of the California Co. after having been completely overhauled, has again started up, and this time upon ore from their own mine. They intend running through their batteries 100 tons of ore before stopping.

We were shown yesterday some very strange looking rock from the Camp Co's claim, on the shooting Star ledge. The specimen shown us was from the bottom of the shaft, which is about 60 ft. deep. It assays immensely gold, silver, and copper.

A partial clean-up made at the Mohawk and Montreal mill a few days since, gave a result of about \$21 per ton. They are now taking out a very superior class of ore.

The rich body of ore recently struck in the Gold Run mine still continues.

The same paper alludes to its report on the Green Emigrant (named after the rich ledge in Placer county), and says that the figures were understated. The mill returns show that the ore worked paid over \$27 per ton. The gold is .891 fine.

## Placer County.

The Dutch Flat *Enquirer* of July 29th, says richer rock has been struck in the lower level of the Redstone mine. Permanent water power is to be obtained by a ditch of about a mile in extent. The company are enthusiastic.

## Sierra County.

Downville *Messenger*, July 27th: We noticed, last week, the finding by some Chinamen, at Kanaka Flat, Kanaka creek, in the southern portion of the county, of a piece of gold weighing 45 lbs. This week we learn that another piece, weighing 41 lbs., was recently discovered by some Chinamen at Kanaka Flat, on the South Yuba.

Whisky Diggings correspondence of same: Mining is being prosecuted with vigor and success by several companies. The Nevada, North America and Swift Sure companies are washing out splendid pay. Several of the owners in the Nevada and North America sold out and left for the States this spring, with from \$8,000 to \$20,000 each.

Messrs. Bona & Co. have struck a very rich and extensive quartz ledge in the immediate vicinity of town. An average specimen of the rock assayed in San Francisco \$200 a ton. The northern extension is owned by Murphy & Co. Both companies are preparing to erect mills. The southern extension is owned by McNally & Co.

Editorial correspondence of the *Atlas*, July 16th: The Big Blue lead is not producing much now compared with its former yield. The large ditch which supplied Forest City, Allegheny, Chips' Flat and Minnesota with water, a few years since, is now in ruins, because there was not enough

demand for water to pay for keeping the ditch in order. . . . W. S. Sherwood, formerly of San Francisco, has managed, with the assistance of capitalists, to buy up a number of old claims, which were worked without drainage or system. He is now running a large tunnel that will enable him to drain the whole tract (80 acres) . . . The Consolidated mill, belonging to San Francisco capitalists, cost them \$90,000. They could not find any mine on their claim, and the mill has now been taken down, and is to be set up six miles above Forest City. . . . The Sierra Bnttes, or Reis mine, still continues its wonderful yield. It has paid, without interruption, for 16 years, and not less than 90,000 tons have been taken from it, and it now has 45,000 tons of pay ore in sight. The total production last year was \$224,000; the dividends, \$144,000; the expenses, \$70,000.

## Sierraville County.

Yreka *Union*, July 27th: We learn that about 20 men are engaged in mining on Hazel creek, a stream that runs into the Sacramento from the east, about half way between Soda Springs and Dog creek, and that they are doing well. One piece has been found there worth \$250. Other nuggets weighing 5 and 6 ozs. have been found.

Mining is flourishing on Humbug. Water bids fair to continue abundant for some time to come. On the North Fork and on Little Humbug, rumors prevail of the claims paying rich, and over on Barkhouse and vicinity more mining is carried on this season than ever before.

## Shasta County.

*Courier*, July 27th: Times are reported lively at Dog Creek and Portuguese Flat. The claim owned by Robert Pitt, on Portuguese Flat, is considered the best on the upper Sacramento. The gravel is from 20 to 30 ft. deep, and contains gold throughout. Several claims have lately been opened on the lower bars along Dog creek, which are yielding excellent pay.

A company was recently organized to search for the continuation of the old Fifer Hill lead at Pittsburg, and a tunnel has been run 50 ft. into an adjoining hill for that purpose. At last accounts the workmen had struck into a chanel, which they believe to be the lead. Six pans of the gravel taken out and washed yielded \$15.

## Trinity County.

Shasta *Courier*, July 27th: Fred Deiner, of Minersville, owns the richest paying claim in the State. It is located on a small stream called Digger creek, which was partially worked in early times and afterwards abandoned. In one week recently he picked up \$3,000, and in one day last week picked up 150 ozs., and every day not less than 20 ozs.—all picked up from the ground in coarse pieces. It is supposed there is as much more in the sluices.

## ARIZONA.

From the *Miner*, July 13th: Except at Wickenburg and Big Bng, the mills are idle.

To sulphurets, poor machinery, but most of all a want of capital, may be attributed this general and depressing stoppage of operations. The process as tried at the Sterling mill was considered a success, but the worthy parties lacked the means requisite to prosecute the work as they would, and so have suspended operations.

It is evident that until the price of living here is reduced it will require large capital to operate in quartz, especially where it is found only in sulphurets. At Wickenburg, the Vulture mine, which continues to furnish free gold, is paying finely. We hear that 174 tons worked last week returned \$13,000.

The water arastras on Lynx Creek and the upper Hassayampa are doing well.

Same of 18th: Reports from the mining districts are not encouraging. Most of the works on Lynx Creek are closed. On the Occidental, work is being pushed steadily. A. L. Johnson, who has a lease of 300 ft. of the ledge for one year, is opening it up. A considerable quantity of very rich rock has been taken from the upper shaft. The upper tunnel is in 75 ft. The rock has yielded on an average, \$85 to the ton. Out of this tunnel ore yielding \$4,000 has already been taken.

## COLORADO.

From the *Times*, July 9th: The Gold Rock Mining Co's mill started this morning on ore from the White Cloud lode, for Capt. Whiteher.

Mr. Hinds has hired 12 stamps in the Lexington mill, to crush from the Adeline on behalf of the company. He has a large lot of second quality ore out, which pays well. Last week he obtained \$410, as the week's run.

Col. Tennatt has commenced work on the Fiske lode.

Potter & Co. are putting a new style of desulphurizer in Ward Dist. The cylinder is 22 in. by five ft. in length. Several tests

have been made, and one from 90 lbs. of ore from the Arizona lode, yielded \$9 in gold.

*Miner*, July 11th: The Trowel Mining Co. commenced work on the Bazaar lode last Monday. This vein is on Saxon Mountain.

The Silver Creek Mining Co. are developing a lode, near the summit of Democrat Mountain, the ores from which are astonishingly rich in silver.

We understand that Mr. Rockwell yesterday made a sale of one-half of the New Boston lode to a couple of gentlemen from Vermont.

Dr. Johnson, Supt. of the Georgetown Silver Smelting Works, on Tuesday morning last took off 1,212 ozs. of silver bullion, the coin value being \$1,636.20.

Denver *News*, July 10th: S. H. Butler has located a new discovery within 40 miles from Denver. Water is plenty, and it is thought that from \$10 to \$20 per day to the hand can be made.

Mining operations in the southern counties—Park, Summit and Lake—are at last fairly commenced.

At Fairplay, five or six companies are at work; employing from 10 to 25 men each, and the average yield is reported at something near \$10 per day to the hand.

In Summit county, nearly all the ground that has ever been worked will be worked again this season.

In Lake county the gulches and bars of known richness, are being actively worked. The Cash Creek flume is reported as yielding \$25 per day to the man. At the mouth of Lake Creek they have \$10 diggings. Richey's patch, Colorado and California gulches, are paying about as in former years. Work in Lost Cañon was to begin on the 1st inst.

Work on the lodes in Red Mountain Dist. was to be commenced on the 1st inst. La Plate has been opened for two or three weeks, though but little was done toward mining until the last of June. In Granite Dist. a good deal of prospecting is going on, both in gulches and for lodes.

## IDAHO.

From the *Avalanche* of July 20th: The ore now coming from the Oro Fino to the Morning Star mill is richer than at any previous time this season. That the ledge is large and of rich average quality there is no doubt.

A large number of claims on Nappies and other creeks, after having been worked from two to six weeks, are for sale cheap.

On the Poorman extension works, the lower shaft is temporarily stopped on account of water, but the upper shaft and tunnel are going into the mountain as fast as night and day work can drive them. The Baxter in the ridge south of Wade's Gulch, is unquestionably a true vein, and at the present depth of nearly 50 ft. is two ft. wide and of fine appearance.

Lewiston *Journal*, July 11th: At Florence and Warrens, the claims are generally yielding well. The quartz veins are promising well. The new ditches on Salmon river, of White & Shissler, and the French Co. are in full operation. The French Co. washed off the top sand from a small portion of their diggings and saved 36 ozs. of good gold dust in their sluices, without shoveling in any of the gravel.

Same of 18th: The mill for Warrens, which was to come from Portland, is a fizzle. The Miners' Quartz Mill Co. will order machinery at once from San Francisco, and if possible have it in operation by the last of September.

On the Rockfellow lead, they now have a tunnel of about 600 ft. in length, tapping the vein at the depth of 175 ft., and the vein so opened as to materially reduce the cost of extraction. The vein is from three to four ft. wide at the terminus of the tunnel. The ore is hard, but exhibits in places remarkably rich veins of thread gold.

Further openings have been made upon the *Hic Jacet* vein, and the ore still grows richer.

A new discovery has been made on the divide between Warren and Slaughter creeks. The vein is christened the Black Hawk. It is 13 in. wide, and exhibits rich silver ore.

On account of the failure of water, the arastra of Morton & Long will suspend operations next week.

A letter from Florence, July 15th, says: There will double the amount of gold taken out this season that there was last. The Harper & Liddle tunnel is progressing finely.

## MONTANA.

Diamond City correspondence of *Helena Gazette*, July 10th: Messrs. Tylor & Allen have a drift on the Ballarat a distance of 135 ft.; this has a well-defined crevice of 3 ft. in solid walls, and assays \$120 per ton. On the Star & Bobtail, the quartz looks

well. An Eastern company will erect a mill on these lodes at an early day.

King & Gillette are constructing a bed-rock flume in Confederate Gulch. They are employing 24 hands, working day and night.

Dennis Shobe & Co. are working Boulder bar by hydraulic and ground-sluicing. They are obtaining an excellent yield of coarse nugget gold. Mr. Shobe showed over \$300 in beautiful nugget gold that was picked up from the bar in a few minutes' time.

Good pay has been struck in the main gulch on No. 70 by Mr. Spearing, obtaining \$90 to the set of timbers.

Montana Post, July 13th: At the confluence of Sawmill and Brown's Gulches, the Golden Gate Co. is preparing for the erection of a 15-stamp mill. Timber is being taken out, the lumber prepared, and everything will be far enough advanced to put the mill in operation 40 days after the arrival of the balance of the machinery from Benton. The mill will be run on custom quartz until the leads of the company are developed.

The Louane has, at a depth of 20 ft., a crevice of 4 1/2 ft., with 2 1/2 ft. of rich rock, smooth, perfect walls, and assaying from 20 tests an average of \$192.21, about 80 per cent. of which is silver and 20 per cent. gold.

Ore from the True Silver lead shows globules of silver in nearly every piece when smelted in an ordinary furnace. The Osceola and Minniska also prospect finely. Stanton & Co., on the Black ledge, have a 3-ft. crevice of good ore.

The California Co. have commenced constructing a flume to their ground. . . Hedge & Brown have erected a hydraulic on the point immediately below Brown's Guleh, and are taking out \$25 per day to the hand. . . The Davis & Patton flume is a perfect success. . . Donagan is working ground on the hill opposite Nevada, and is taking \$20 per day to the hand.

The ditch to El Derado bar has now become a fixed fact. The bar is three miles long, and runs back from the Missonri river two miles. The ground has been pretty extensively prospected, and with water to ground-slucice will pay from \$25 to \$30 per day to the hand. The capital stock of the ditch is \$35,000, divided into shares of \$100 each. The estimated cost is \$44,000.

Democrat, July 18th: The Gold Mountain lode has been purchased by the Gaston & Simpson G. M. Co. for \$23,000, cash.

Messrs. Blackman & Co. are now working the ores of the Rush lode, Junction Dist., in an arastra, and will clean up this week.

In Madison county, there are 23 quartz mills and five arastras completed or in process of erection.

**NEW MEXICO.**

The *New Mexican* learns from parties direct from the Pinos Altos mines, that there are now in and about these mines nearly 1,200 miners, and the number is continually increased by arrivals from Arizona, California, Colorado and Texas. The Pinos Altos Mining Co. has commenced work with their new quartz mill, and the result has exceeded their most sanguine expectations. One of the firm refused \$25,000 for his interest in the lode.

**NEVADA.**

**Reese River.**  
From the *Reveille*, July 22d: We were shown to-day a magnificent specimen of antimonial sulphureted ore, taken from a depth of 260 ft. on the Fortuna ledge on Lander Hill. The ledge at this depth is of good size. The machinery is arriving for the fine mill of the Combination Co. to be erected in the Silver Bend Dist.

Same of 24th: Mr. S. P. Roberts appears to have struck it rich in his great Silver Mountain ledge in Ophir Cañon, Twin River Dist. In an opening a few feet below the surface he obtained ore assaying as high as \$500 per ton.

Mr. G. B. Montgomery called at our office this morning with a grand specimen of ore from the Old Dominion ledge at Hot Creek. The specimen was of large size, and the rich purplish brown horn silver extended through the mass. Some two tons of the ore were brought in and delivered to the Keystone mill for reduction.

Same of 25th: Work has been resumed upon the Savage mine, with every prospect of being continued under favorable circumstances. A level is being run to the westward—from which almost no ore had been hitherto extracted—in which a large vein is developed, and the ore though not of a high grade is of a good milling quality.

We learn from Cortez Dist. that the mill of the Mount Tenabo Co. is working finely, and that several hundred pounds of bullion had accumulated. The bullion will be

melted and assayed at the mill, and furnaces are being erected for the purpose. The first shipment of silver bars will be made about the 1st of August. Vigorous and systematic work is going ahead upon the Cortez Giant mine of the company, attended by encouraging developments. The St. Louis mine continues to yield an abundance of high grade ore.

The "Goose Creek Rangers" have returned. Although the party left Austin for Goose Creek, they did not get within 100 miles of its waters. Before they had fairly prospected their discoveries, they were obliged to return hither for provisions, but they believe they have found the "richest thing" or the "biggest bilk" in the country. Gold was discovered some five days' journey from this city, 60 or 70 miles northeast of Gravelly Ford, on the Humboldt river, in a gulch which they named McCaun Gulch, in which there is a stream running about 1,500 in. of water, emptying apparently into the Owyhee. They also discovered quartz ledges in the vicinity, organized the Tuscarora Dist., and adopted regulations similar to those of the Reese River districts.

Same of 26th: The Keystone mill will be closed in a few days, for enlargement and general improvement. The mill will now be furnished with two additional roasting furnaces, making eight in all; and its pans will be increased to 14 and its settlers to six. The pans will be entirely new; the battery will be repaired; and the gearing machinery overhauled and put in the best condition. These repairs will be completed in about three weeks.

Silver Bend Reporter, July 20th: A few tons of ore from the Northumberland ledge, in the district of that name, were recently reduced, and yielded about \$85 per ton. The ledge is about 6 ft. thick, and this is said to be only an average of the ore throughout its entire width.

We understand that at a depth of about 25 ft. upon the Silver Queen location, just north of the Silver Champion, a splendid body of ore has been found about 4 ft. in thickness. Also, that at a depth of 80 ft. upon the Mountain Queen, lying between the Transylvania and Quintera, a ledge has been developed which shows a stratum of good milling ore 4 ft. wide.

In regard to the suspension of work on the La Plata mill, at Park Cañon, we have received a note from the Supt., G. B. Montgomery, which says: "The inability of the Supt. to get the mine properly opened is, I presume, the principal cause of the temporary suspension of work on the mill. The adamant hardness of the rock has made the progress much slower than was expected. In vindication of myself, I may say I have employed none but the best miners, have had as many on night and day as could be worked to advantage, and will continue to push the work just as fast as it can be done in such rock. I presume work will be resumed on the mill as soon as the mine is penetrated in the second level and opened to some extent."

Same of 27th: We learn that Messrs. Coffee & Robinson, who have been inspecting the mines of this district, will immediately remove to this place from Esmeralda county the Bodie mill, of eight stamps, owned by them. It will be used as a custom mill.

Several loads of ore from the McAleer mill will arrive to-day, via Austin.

**Pahranaगत.**  
From the Silver Bend Reporter of July 20th: Times here are dull, but we are all waiting for something better, which yet seems a long way off. Mr. Ostram is pushing the work along on his 10-stamp mill. It will probably be ready to run by September next. Mr. Island is developing his mines.

Same of 27th has a letter from Hiko, July 19th. We quote: All of the money expended upon the mines of Pahranaगत has been under the direction of confident and overweening inexperience and extravagance, and therefore there have been no very beneficial results to this section, nor can we hope for any until a radical change occurs throughout our entire system of mining operations. Our mines are unsurpassed, but we must have men to develop them who are practical, and will not be blinded in their judgment by obsolete theories.

*Reveille*, of 25th: We received, the other day, a sample of coal from Mr. Henry Raymond, of Pahranaगत, which is said to have been discovered about 15 miles from Hiko, the county seat of Lincoln. It is a good-looking article of anthracite coal, and was found in a vein 15 inches thick on the surface.

**Washoe.**

[In the Stock Circle, in another portion of this paper, will be found late mining news from this district.]

From the *Trespass*, July 27th: During the past week there has been dispatched from the office of Wells, Fargo & Co., in this city, 5,114 lbs. of assayed bullion, valued at \$124,260.63; from their office in Gold Hill, 4,241 lbs., valued at \$121,674.66.

The heavy cog wheel and pump crank for the Gould & Curry Co. have arrived, and will shortly be put in position at the Bouncer shaft.

Messrs. Janin & Parks are building a mill in the cañon below the Gould & Curry, which will be used entirely for the working of concentrated tailings. The mill is 80 ft. in length and 40 in width, is located close by Paine & Stevens' new separator and sulphuret-saver, and will work its concentrations.

In the north mine of the Savage, a considerable vein of water was penetrated Thursday. The first winze, better known as the middle winze, has been passed, and the drift is now being pushed for the north winze, 235 ft. distant, with a probability of running in good ore the entire distance.

In the new Hale & Norcross shaft, a large body of water has been encountered and has become somewhat troublesome. The lower levels of the mine are looking well.

Repairs on the Bullion shaft are nearly completed.

The Overman ore now averages \$45 per ton. Four mills are engaged in reducing it.

*Territorial Enterprise*, July 27th: At the south shaft of the Yellow Jacket two new 60-horse power engines have been erected for hoisting, while the old Corliss engine, which formerly did all the work, will be used for pumping only. New rails have been put in, all the car tracks on the surface have been reconstructed, and the mine is now in a shape to be easily and profitably worked.

The frame of the main building of the new hoisting works of the Crown Point Co. is now up, and the machinery will be put in position as soon as possible. The new works will be first class in every respect.

The new hoisting works of the Sierra Nevada mine are nearly completed, and the machinery is being placed in position. The new plunger for the big pump is at the works, and the pump will be ready and work recommenced in the mine about the 1st of September.

**OREGON.**

From the *Sentinel* of July 13th: There are continued good mining prospects in Jackson county. More diggings have been struck in the vicinity of Pleasant creek. A continuation of an old channel has apparently been found, richer than ever. The gold obtained is coarse and heavy, being worth \$16.50 in this market. Pleasant creek, heretofore, has been considered one of the best mining camps in the country, and if this new discovery proves to be as rich as it is now thought, it will firmly establish its reputation for rich diggings.

Another lump of gold has been picked up in Jackson county, which is large enough to awaken some of the buried recollections of '49ers. It weighs 146 ozs.

A letter from Canyon City to the *Mountaineer* says: We expect to have our quartz mill up and in running order before the middle of next month, on Elk creek, when Grant county will show the world that she is rich in gold-bearing quartz. The L. X. L. Co., at Prairie Diggings, four miles from here, also contemplate putting up a mill this season. Their prospects are very flattering for large returns.

The *Oregonian* says parties are trying to procure a quartz mill in Portland, to be located in a newly-discovered rich quartz district on the middle fork of John Day river.

**UTAH.**

The *Vedette* of July 20th, says of the mines on Strawberry: We have not yet such information as we consider reliable, in relation to the extent and richness of these new mines. Rumors of all kinds are afloat and persons in business and out of it are rushing out there wildly. It is said that a few persons came in from there very quietly, flitted about town so noiselessly that they were not "shadowed," and suddenly disappeared.

Col. Bright, Special Postal Agent, has arrived in town. He is said to report that the new mines are good; that the quartz lode discovered is a rich thing, and the placer diggings, as far as opened, were paying from \$15 to \$30 a day. On the strength of the late accounts numerous other parties will start for the new El Dorado to-morrow and next day.

The Reese River *Reveille* says the excitement grew out of some new developments on Willow Creek, at a point some 15 miles from the telegraph station at the South Pass, and about 260 miles east of Salt Lake city.

The Salt Lake *Telegraph* of the 19th inst. says, that a Mr. Gilmore returned from the

mines of South Pass, and called at its office with a few specimens of the gold. There were about 50 persons there when he left, but hundreds were on the way. He reports the diggings as near the headwaters of the Sweetwater, four miles from Lander's Oregon cut-off, eight miles from the Lander junction with the South Pass, and about 12 miles from the Pacific Springs. The travel from Salt Lake city passes through Bridger, over Ham's Fork at Granger's ferry on Green river, and thence to the first crossing of the Sweetwater by the old emigrant road.

Address, **DEWEY & Co.,** Mining and Scientific Press Office, San Francisco 1413-1414

A BOY PREACHER has appeared in Wales who, according to his admirers, is to surpass Mr. Spurgeon. This promising youth is Master Enoch Probert, who has just completed his eleventh year. A local paper says of him: "He has a sweet and powerful voice, which he manages well. His delivery is remarkably distinct, and his hearers were astonished at each remarkable truth from a boy of such tender years."

## Mining and Scientific Press.

W. B. EWER,..... SENIOR EDITOR.

O. W. M. SMITH. W. B. EWER. A. T. DEWEY.  
DEWEY & CO., Publishers.

Office—No. 605 Clay street, corner of Sansome, 2d floor.

Terms of Subscription:  
 One copy, per annum, in advance,.....\$5 00  
 One copy, six months, in advance,..... 3 00  
 For sale by Carriers and Newsdealers.

WRITERS should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1865.

Dr. L. C. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. Alfred H. Nahor, is our duly authorized traveling agent for Amador and El Dorado counties. July '68.

Mr. W. D. Root is an authorized agent for this paper for Nevada State. August 1, 1867.

## San Francisco:

Saturday Morning, Aug. 3, 1867.

## Notices to Correspondents.

NUMULUS is desirous of knowing the date of the earliest coinage, and also the order in which the metals were first formed in the shape of coined money, as is recognized in the present age. We have already, in part, explained one part of this query, which will be found in our "Notices to Correspondents" of the first of June. There can scarcely be a doubt but that the Greeks were the first inventors of a proper coinage; nor a single coin, or the mention of a single coin, of any other nation is banded historically down to us prior to the earliest known Greek coin. As a means of exchange, but precedent to the coinage of proper money, antiquarians generally concur that silver was first employed for this purpose in the shape of pins, or pieces of wire, of which a certain conventional number was termed a bandful. Marco Polo describes a similar currency in gold as being used in some of the Chinese provinces which he traversed. The gold was formed into small rods, from which were cut certain lengths, which passed according to their weight. It is supposed that about six or seven centuries before the Christian era, solid bands of silver, corresponding to the "bandful," came into use at Aegina, which, as a pledge of their value, was impressed with a stamp or public seal. Herodotus, however, supposed that the coinage of money was first attempted by the Lydians; and some gold and silver coins found around its ancient capital would tend to place the introduction of coinage as early as the time of Croesus. The age of these is, however, problematical. After silver, a small kind of copper coinage was introduced, which, however, only circulated as a species of token. The gold coinage at the time of Aristophanes (430 B. C.) consisted of darics. About four centuries before Christ, Pericles enumerated amongst the resources of Athens gold and silver in the form of bullion and minted silver, but no minted gold.

THEOLOGIAN.—Genesis and geology are respectively in many points discordant with each other when examined in minute detail, especially if taken in a literal sense. In one, and that the most important respect of all—namely, the Genesis of Creation—the revelation of Holy Writ and the speculations of the most brilliant scientists the world has produced are completely accordant. "In the beginning, God created the heaven and the earth. And the earth was without form and void; and darkness was upon the face of the deep." With the words italicized, the Bible and the opinions of philosophers perfectly agree. Constantly and accumulating observations corroborate the description given.

NEW QUARTZ MILL.—A large engine and quartz mill was shipped from this city, on Friday last, for the Eureka mining company at Grass Valley. The machinery was manufactured at the Vulcan Foundry.

## The Central Pacific Railroad.

Having recently passed over this grand thoroughfare, we propose to offer a few observations, which have been suggested by the trip. The present terminus is at Cisco (a badly-named town), ninety-four miles from Sacramento. Fare, \$9.50. The managers of the road have ever shown exceeding liberality to excursionists, and now offer tickets to pleasure-seekers to go and return at half price.

Our train of two well-filled cars started at 6½ o'clock A. M., drawn by the California-built locomotive, "A. A. Sargeant." Breakfasted, fifteen minutes, at the "Junction," seventeen miles from Sacramento, where our Marysville friends took the Northern California Railroad, leaving us plenty of elbow-room during the rest of the trip. At Rockland, twenty-five miles from Sacramento, we passed the granite quarries which are supplying excellent material for the State Capitol and the Fort Point fortifications of San Francisco harbor.

From Rockland to Colfax, some thirty miles, we have the changing scenery of California foothills and mountains, pleasant and common-place to old mountain rovers, but of a brightening interest to the amateur beholder. Beyond Colfax, we pass "Cape Horn," describing a three-fourths of a mile circle, as of a race-track, viewing from the inner side a steep ravine and deep, gorges scenery. Almost the entire road from this point upward is an ever-varying system of curves, around which our train seemed to meander as easily and gracefully as a fairy waltzer. Suddenly we are overlooking (almost overhanging) the buff-colored bed of the American river and its forks; the precipice below our track being 1,500 feet high. Rarely has it been our privilege to view so grand and picturesque a landscape, even in the most inaccessible and wild recesses of our famous California mountains.

For four or five miles above Emigrant Gap the track is laid upon a bed of hard lava cement, after which we abruptly strike upon the clear, solid granite, forming an immense belt four miles in width, and extending to the present terminus. It is here this great work shows in all its stupendous magnitude. From point to point the rails appear as mere pencil marks upon the white granite, laid upon a track grooved out of the adamantine sides of an almost continuous precipice, while the locomotive follows the firmly-imbedded rails, with its shrill whistle echoing from a thousand reverberating, rocky points, grand, towering, rugged peaks, and jagged, deep-mouthed cañons. Acres of as fine and true blocks as ever entered into the construction of a palace have been thrown down on one side by the powerful blasts, and now lie in different piles, supporting the embankment of the road in some places to the depth of hundreds of feet. The altitude of the road here is about 6,000 feet. Upon the granite range rests innumerable lakes, in basins beautifully fringed with fine foliaged firs and pines. Looking west, the railroad overlooks one of these crystal sheets and the tops of its surrounding pines.

Just above the grade, two miles below Cisco, is situated Crystal Lake, with an area of over 100 acres. No grander location or truer name could be chosen for it. Climate cold and bracing, exceedingly favorable for invalids. The air (especially to those who climb the surrounding hills) is decidedly appetizing. Mr. Fogg keeps a comfortable house, and Crystal Lake is destined to become an extensive resort.

The morning train arrives at Cisco at 11.30, making ninety-four miles, with an ascent of 6,000 feet, in about five hours, averaging, exclusive of stoppages, some twenty-five miles per hour. This train connects with the stages (three in number) for Virginia City, State of Nevada. On its return, the train leaves Cisco at 1.30 P. M.,

taking the morning passengers from Virginia City, arriving at Sacramento at 6.40 P. M. Another train goes east from Sacramento at 3.30 P. M., returning from Cisco at 7.45 the next morning. The conductors of these trains are obliging men.

For days, the novelty of seeing and hearing the movements of the locomotives and trains amid such gigantic rocky masses and remote mountain scenes, failed to lose its impressive greatness upon one's mind.

We shall next week speak briefly of the grade, tunnels, workshop, etc., of this road.

A CALIFORNIA MINE OF GRAPHITE.—We condense the following from the correspondence of the *Bulletin*: The Messrs. Macomber, of Tennessee Gulch, near Wood's Creek, about a mile and a half from Sonora, Tuolumne county, discovered in 1853 a well-defined vein of plumbago, of 18 to 20 feet in width. But little was done towards developing it until within the past year or two. The Messrs. M. commenced the working with a primitive barrel-churn arrangement of their own construction, by means of which the graphite was separated from the sand and other impurities, and suspended in water, was run into shallow tanks and settled. The water being then drawn off, the sediment was dried in the sun, and was ready for market. A considerable quantity, prepared by this means, was sent to New York and to England, where its excellent quality created a demand for it at \$100 per ton. The Messrs. M. are now prepared to work the mine in a systematic manner. Iron cylinders, moved by water power, took the place of the wooden barrel turned by hand. By this means, from 25 to 30 tons per week were prepared. But the demand increasing, improvements were introduced by which nearly that quantity is prepared daily. Instead of the cylinders, a sort of arastra or puddling machine, 20 feet in diameter, is used. A tank 200 feet in length capable of holding the proceeds of 30 days' work, receives the water which runs from this, holding the black-lead in suspension.

The total cost of production, including bags, freight to this city, and freight to Liverpool or New York, is not more than \$50 per ton; leaving a profit of \$50.

THE MARTINEZ FLOUR MILL.—The new flour mill of Coffin & Standish, which we have already noticed as in progress of erection at Martinez, is rapidly approaching completion. It is intended that this mill shall be one of the most complete in the State. It has a large capacity for storage, and the wheat which will be handled entirely by machinery, will be cleaned in the most thorough manner, passing through suction fans and blowers, and compound screens, at least five times. Captain Coffin is one of the earliest pioneers, and no man stands higher than he does as a man of probity and correctness in all matters of business. His partner, Mr. Standish, is a thorough master of the flour business, and we predict for their brand a reputation which will be excelled by no other of the kind on the Pacific coast. Captain Coffin is not the man to do anything loosely or by halves.

NEVADA COUNTY.—A recent brief visit to this county afforded us much pleasure. Its mines show plain evidences of permanent thrift. Sections which will permit the combining of mining with agriculture, horticulture and domestic manufactures, are destined to increase in popularity in every part of our State. Nevada City has steadily improved. Its handsomely-improved homesteads prove that its fortunate citizens are content to remain in the land which gives them wealth. Grass Valley has increased its proportions beyond all precedent in the history of mining towns. Business at present is dull in both places. This dull in affairs, we trust, however, is only the forerunner of a healthy re-action. We regret not having been able to make a more extended visit in the county.

## A Bread-Making Machine.

We have often wondered, as we have witnessed the slow process of kneading, weighing and molding the dough for bread, that some genius has not, long ere the present time, in this inventive age, devised some kind of machinery by which this tedious and simple labor may be abbreviated; especially in our large baking establishments, where the great length of time required for so much manipulation often seriously affects the quality of the bread itself. These considerations having often been forced upon us, we were not a little surprised, a few days since, at receiving a polite note from Mr. John DeArcy, corner Third and Perry streets, in this city, to call at his bakery and witness the operation of a "Bread Machine." Having availed of the opportunity, we were shown into a room, one corner of which was filled up with wheels, shafts, boxes, etc., which Mr. DeArcy assured us were the remains of condemned bread-making machinery, which he had been at work upon for the past three or four years, until the result of his experiments had finally culminated in a simple and effective machine which, with two assistants, he immediately commenced to put in operation.

The "sponge," or dough, was placed upon a long table or bench, such as is generally used by bakers for such purposes. A workman cuts off a piece large enough to make about six or eight loaves; this mass of dough is then placed in an inclined trough, from which it slides down between a pair of wooden rollers, by which process it is drawn out and worked. After passing three times between these rollers it is removed to another set of rollers near by, which are accurately ganged, according to the weight of loaves required. As it passes through these, it is received upon a revolving apron, by which it is taken away from the rollers in a long ribbon-like sheet, of uniform thickness and width. As this sheet moves along, a revolving knife is made to cut it into equal lengths, each length being of the precise weight for a loaf. Precision is arrived at by the dough being brought to a uniform density by being repeatedly passed between the rollers as described. As the loaves are thus laid out on the apron, an attendant quickly folds them up into a proper shape for baking, and places them into suitable receptacles in which to "raise" and be taken to the oven.

By the aid of this machine, the work of two and a half hours, by the usual hand process, is readily accomplished in thirty minutes. Besides the saving of time, a great improvement is effected in the quality of the bread. It is well known to all bakers and good housewives, that when bread is fermented by yeast or leaven, the flour undergoes a change, or partial decomposition, giving off carbonic acid; and that, if the fermentation is not arrested at the proper time, by baking, the resulting bread is sour. Housewives endeavor to correct this acidity by adding soda, or saleratus, thus producing a compound unfit for a human stomach.

In large baking establishments it is found impossible, with the ordinary force of hands employed, to weigh and mold the loaves after the dough is ready for that operation, before the fermentation has proceeded too far; and the consequence is sour bread. The baker cannot help it—he has too much manual labor to perform, and which must be done to avoid it.

Now this machine of Mr. DeArcy comes in just here, and relieves the baker of this annoyance by the speed with which it works, and enables him to be always sure of his "batch," and his customers need never be troubled with sour bread. All this is in addition to the saving of time, and consequently of money, which is the equivalent of time.

Mr. DeArcy has made application for a patent for his invention through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, and will soon be prepared to furnish his important improvement to the trade generally. In the meantime, he will be happy to show the working of the machine to such as may feel interested in its merits. It may be seen at work every day about 11 o'clock A. M. We look upon this as one more addition to the really meritorious inventions of the Pacific Coast.

**THE NEW MARKET.**—The new California Market was opened for business on the 1st inst. The public were admitted on the previous evening, and the institution was pronounced a "success." The building has a front of 175 feet on Pine, and 75 feet on California street. It is 275 feet in depth, and 21 feet in height to the ceiling. The large and convenient basement has a height of 10½ feet, and everything necessary to be done about a market, which might offend the senses of sight or smell, is done there. The arrangements for drainage are very complete. All offal is at once disposed of by the way of the spacious sewer. The floor of the basement is of asphaltum, and is so inclined that water flows at once into the drain. The stalls are in rows with wide passage-ways between; and those devoted to the different kinds of provisions are systematically arranged, each class by itself.

The cost is given at \$260,000, including the amount paid for a portion of the old Washington Market, purchased by the proprietors of the new structure. The rent for stalls is about \$50,000 per annum.

**RAILROAD INVENTIONS.**—We were shown, last week, several inventions of Mr. I. H. Graves, master mechanic of the C. P. R. R., at Sacramento. His device for reducing the friction on car wheels while turning curves, appears plain and practicable. Its saving of power has been demonstrated by the application of a dynamometer of his own construction, which measures the force of resistance of a car ascending grades or turning curves. Another invention of Mr. Graves' consists in a new method of confining the sparks and fine cinders in the smoke stack of a locomotive without obstructing the draft. Another important one is that of enlarging and contracting the size of the steam exhaust pipe—changing it readily and gauging it accurately—by which means considerable fuel is saved.

These improvements are all in the line of Mr. Graves' business, and their merits have been tested by practice. At a proper time we shall be permitted to give a full description of the inventions.

**MINING SUITS.**—Three important suits against the Union Copper Mining Co. were tried at the recent session of the District court held in San Andreas, Calaveras county. The amount involved is over two millions of dollars. The first was that of the Inimitable Mining Co., claiming that the Inimitable and Union were two different leads. Verdict for defendants. The second was that of Mortimer Phelps, to recover one-thirteenth interest in the Union mine and property. Verdict for the plaintiff. The third was that of Estella May Reed, (daughter of Wm. K. Reed, the discoverer and locator of the mine,) for two-thirteenths interest in the mine. This suit was continued, and testimony ordered to be taken in San Francisco. Patterson and Storme for the plaintiffs, and H. & C. McAllister for the defendants in each and all of the three cases.

**THE GRAPE CROP** appears to be equally as promising as the grain crop. From present indications it will largely exceed that of last year, and the wine presses will soon flow with new wine, while the delicious fruit of the vine will everywhere abound to nourish and invigorate the system with its health giving qualities.

**THE SEA WALL.**—A. H. Houston has the contract for constructing two sections of the sea wall, for \$280,000, with the probable addition, at the end of six months, of \$70,000; the completion of a portion of one section being contingent upon the condition of the treasury. The spaces included are those between Union and Vallejo, and Pacific and Washington streets. Work will be commenced in about two weeks.

**COMMUNICATION RECEIVED.**—Number two from our Paris correspondent will appear next week.

Office in Boston, No. 10 Central Street. Office in New York, No. 53 Beekman Street.  
1v15-5plmtf

**CAPT. CHAS. H. POMEROY**, Clerk of the Supreme Court of this State, died at his father's residence, San José, July 29th, aged twenty-three years. He commenced his responsible duties in the Clerk's office at the early age of nineteen, rendering efficient service. We have known him for nine years as a youth of bright talents, kind disposition and remarkable promise. He leaves parents and three brothers, who must keenly feel their sudden loss. They will receive the sympathy of all who knew the deceased.

**NEVADA FOUNDRY.**—This establishment, at Nevada City, under the proprietorship of Messrs. Hough & Thom, performs a wide range of work to suit the wants of the mining and mechanical community in which it is located. New machinery is now on the way from the East for extending and improving its stock of tools. The works are soon to be enlarged by the addition of a new machine shop 40 by 80 feet, and a blacksmith's shop 40 by 40 feet, to be constructed of stone or brick in a permanent manner. A thirty-five horse power engine is a sample of the work turned out. The manufacture of castings for quartz mills, and other machinery in local use, forms a specialty of this foundry. Some \$50,000 worth of work is done annually.

NORTH AMERICA  
Life Insurance Company.

Usual Restrictions on Occupation and Travel  
ABOLISHED!

Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.

The most Responsible and Liberal Company in the World!  
J. A. EATON & CO.,  
Managers Pacific Branch, 302 Montgomery st.  
2v14nr9p SAN FRANCISCO.

**CONTRIBUTIONS FOR OUR CABINET.**—We have received several rich samples of silver ore from Mr. A. J. Rigby, which we shall describe in a future number. Also several fine specimens from Grass Valley.

**CONTINENTAL Life Insurance Company**  
302 Montgomery street, corner of Pine.

Persons desirous of obtaining the finest Wood Engravings, can procure them only by having the picture photographed on the block, by  
D. H. WOODS,  
No. 28 Third street.  
1v14tr

FOR CABINET PHOTOGRAPHS, or Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street. Every picture warranted to give perfect satisfaction.  
5v15gr B. F. HOWLAND, Artist.

**Gold Bars**, of whatever size. If well cast, assayed for two dollars, at A. P. MOLLER'S Assay Office, 611 Commercial street, opposite United States Branch Mint.  
15v14-3m

**JACOB SHERW**, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street,) takes all kinds of Photographs in the best style of the Art. He would invite special attention to the new "Cabinet Photographs," which he is taking to perfection.  
10v14tr

**Brown's Filtering Heater.**—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to  
5v14-1v AUSTIN A. WELLS, Agent.

**Perry Davis' Vegetable Pain Killer.**

A CERTAIN ANTIDOTE FOR POISON.—REV. T. Allen, writing from Tavoy, Burmah, says: "Within the past four years I have used and disposed of about five hundred bottles, but am now out. Please send me a fresh supply as soon as you can—say two hundred bottles. I dare not be without it myself, and there are endless calls for it, both by Burmahs and Karens. I always take it with me in the jungles and have frequent occasion to use it, both on myself and others. One night, while sleeping in an open Zayat, I was awoke by a most excruciating pain in my foot. On examination, I found I had been bitten by a centipede. I immediately applied the Pain Killer, and found instant relief. In less than an hour I was again asleep."  
Rev. Mr. Hibbard, writing from Burmah to his father, says: "I have used Davis' Pain Killer for Coughs, Colds, Summer Complaints, Burns, and for the Sting of Scorpions, with uniform success. We always keep it where we can lay our hands on it in the dark, if need be."  
Sold by all Medicine Dealers everywhere. 5v15-1m

**Holders' Insurance Company—**  
OFFICE IN THE BUILDING OF THE  
CALIFORNIA SAVINGS BANK, California  
street, one door from Sansome street.  
FIRE AND MARINE INSURANCE. 10v149ppr

**MARKET STREET HONESTY ASSOCIATION.**—J. S. LUTY, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

**Save Your Teeth.**—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty.  
Call and examine the work. Finest quality of artificial work also manufactured. 16v14-1f

ROOT'S  
Patent Force Blast Blower.

Adapted for Smelting, Foundry, Mining  
and Steamships.

Requires 50 per cent. less power than any Blower now in use. For further particulars, address KEEP, BLAKE & CO., Stockton; or Wm. T. Garrett, corner Mission and Fremont streets, San Francisco. 5v15tr10p

Oakland College School.

The PATRONS of this Institution have the choice of several distinct Departments. The SENIOR CLASSICAL is designed as preparatory to the College of California.

The SENIOR ENGLISH affords a complete course of instruction in the English branches, in Theoretical and Practical Business, Science and Art.

The JUNIOR is especially qualified to meet the wants of young boys, for whom separate apartments and Teachers are provided.

Throughout all the various departments, great attention is given to the study of the Modern Languages.

For further information, or Catalogues, address,  
I. H. BRAYTON, Principal.  
OAKLAND, California. 5v15gr9p.

BLAKE'S PATENT QUARTZ CRUSHERS, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT  
24v12 H. J. BOOTH & CO.

THE CATHEDRAL OF MEXICO is the most capacious house of worship in America. It is 500 long by 420 feet wide, and capable of holding 30,000 people. The edifice has been described as follows: "The building is not in conformity with any order of architecture, although remarkably imposing. The walls are built of unhewn basalt, but the front is covered over with the most laborious carving, while massive pillars rise up against the wall for the support of its lofty towers. The interior is gorgeous almost beyond description, though the decorations are more remarkable for costliness than taste. The choir is formed of rare carved woods, and elaborately covered with gilded images; the high altar, raised from the floor on an elevated platform, exhibits a profusion of candlesticks, crosses and other ornaments, of solid gold or silver, and is crowned by an image of the Virgin, decked in jewels, estimated at the value of more than \$2,500,000; and all other parts of the church are a perfect wilderness of columns, statues, shrines, fountains, etc." Such was the description before the late civil war. Most probably some of the more costly ornaments have been "borrowed" by some one of the numerous needy chieftains who have, from time to time, had possession of the city within the past three or four years.

TIN IN MISSOURI.—The telegraph of Saturday last announced the discovery of immense deposits of tin in Madison county, Pilot Knob, Missouri. These deposits are said to be the most extensive ever met with in any part of the globe.

CODRISH are caught in paying quantities outside the bar of Yaquina Bay, Oregon. Flounders and other saltwater fish are also caught in large quantities.

Machinists and Foundries.

**PALMER, KNOX & CO.,**

Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular  
25v12-3m

**PICKING OUT THE EYES OF A MINE.**—It is a common practice among English miners to pass rich deposits in a mine, and leave them undisturbed to fall back upon whenever the general average of the yield threatens to fall below a dividend paying point. These known rich spots are called the "eyes" of the mine, and they are seldom removed when first discovered. The custom in this country is very different. Our miners generally pick out the eyes of a mine as soon as they get within reach of them, and then usually leave the mine to darkness and abandonment. The record of California and Nevada show a good many mines with their eyes picked out; which, with proper management might have been made remunerative.

If the United States and its Territories were as thickly settled as Great Britain, they would contain 750,000,000 of people—a number nearly equal to the whole population of the globe.

To Those Whose Interests We Represent.

While there is every reason for gratification at the circulation which this journal has already reached, we are yet well aware that there are great numbers of miners, mechanics and lovers of science to whom it might be made a source of much usefulness and profit.

New subscriptions will be received at all times by mail or otherwise. Those who have friends that they think might be interested or benefited by the paper, will confer a favor both upon them and us by calling their attention to this matter, and at this time by so doing they will place us under still greater obligations to themselves, and enable us by its increased receipts, to add still more to the value of the paper.

We trust that it is needless to urge upon our readers the necessity of promptly renewing their subscriptions. The two indexes for volumes XII and XIII, which we have already published, and the 500 ample pages of reading matter, apart from advertisements, to say nothing of our numerous engravings and illustrations, speak more for the value which we give for the price of a year's subscription than we can say in this connection.

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States.

Mineral Land Blanks FOR SALE.

We are prepared to furnish any of the following blanks used in securing patents for lands under the National Mineral Land Act of 1866: I. Applicants' Declaratory Statement. II. Diagram, Description of Diagram and Boundaries, and Notice.

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible. n10

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired. This Amalgamator Operates as Follows: The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. This it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY, San Francisco.

\$85 for Hunter's Improved Concentrator.

The patentee is prepared to sell his Concentrators for the above price, and guarantees, when the machines are run according to directions, to give 20 per cent better results than from any Concentrator built on this Coast, and will refund the money if they will not perform what is claimed for them. Machines with copper plates, will cost \$10 extra. The Machine can be

Seen in Operation

At Booth & Co's Union Foundry, up stairs. Parties purchasing Concentrators will do well to examine before buying others of pretended merit. Persons desiring it can have a practical concentration made of tailings at any time, and prove the working of the machine.

FOR \$50.

HUNTER'S EUREKA AMALGAMATOR.

For sale, the right to build and use in mills. A working plan will be furnished each purchaser. Five machines can be seen in operation at the Eureka Mill, Grass Valley. The cost of the iron for the machine, without the iron-box, is about \$100. The box will answer of wood. By reference to the Mining and Scientific Press of May 25th, a full description of the above Machines may be found. For particulars, send for Circulars, or address ANDREW HUNTER, Union Foundry, San Francisco.

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procure, some time since, a rolisue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they who appropriate the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. BLAKE & TYLER, Agents for the Pacific Coast.

QUARTZ MINERS, MILLMEN,

And others contemplating the erection of Reduction Works, for either Gold or Silver Ores, your attention is called to a new, superior

First Class Mill,

In all respects, with Pans and Separators complete. The Mill is adapted for 24 or 40 Stamps.

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Crushing Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low terms: No. 1—10 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600

No. 2—15 inch Crusher, capable of similarly putting through five to six tons per hour. \$850 No. 3—18 inch Crusher, will in a similar manner crush from seven to eight tons per hour. \$1,200 EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is held in a wooden frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to crush the size to which it is intended the quartz shall be crushed. O represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of my desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866.

JAMES BRODIE, Esq., San Francisco: My Dear Sir: I have much pleasure in informing you that for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATOR BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1865. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st No. of the month of October, 1866, the same will be valued to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found to be most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers. A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

Quartz Mill Construction and Superintendence

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a Quartz Mill. Has had five years steady and successful experience in working mills with double quartz operators. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. For particulars, apply to E. M. SHEAF, San Francisco, care Mining and Scientific Press. 26v133m

Notice to Miners, Well-Borers and Water Companies.

M. PRAO IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Staves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbings, down to 12 inch diameter. M. PRAO, 8v13 1y Stove Store, No. 125 Clay street, below Davis.

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the top off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burner cotton must then be withdrawn, and a fresh piece of stout cotton, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCKS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 2v1543m

E. O. HUNT, Manufacturer of Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to suit all the sails so arranged as turn edgewise to the wind when the mill is stopped. The sails can be set in any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person.

HUNT'S SELF-REGULATING MILL is strong, durable and cheap. It is provided with means for stopping, in the most violent winds. This mill is well known throughout the State. Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double-Acting. Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. No. 28 Second St., and 106 and 110 Jessie St. 2v1544y San Francisco.

THIS COMPANY ARE NOW PREPARED TO FURNISH Sulphuric, Nitric and Muratic Acids of superior quality, in quantities to suit. Orders will be received at the office only for Chemicals of every description, which will be manufactured as may be required. The Company beg to say that they have the advantages of all improved machinery and apparatus for the manufacture and manipulation of these products, and our Laboratory is fitted up with the most recent improvements which experience and science suggest, and is surpassed by none in completeness and perfection for the purposes it is designed. 9v14 3m

THE GREAT LIGHT.

THE DANFORD Atmospheric Lamp.

This Lamp burns coal oil, requires no chimney, gives a pure white and steady flame, uses thirty per cent less oil than any other Lamp in proportion to the amount of light afforded, and is absolutely indispensable in every house where gas is not used. CALL AND SEE THEM for sale only by E. F. FERRIS, 2v15 4y 417 Washington street, opp. Post Office, S. F.

Assayer and Chemist.

A GENTLEMAN WELL VERSED IN ASSAYING AND Analytical Chemistry, is desirous of securing a position in some assaying establishment, or would take charge of the assaying and amalgamating department of either a gold or silver mine. Steady employment, rather than high wages, is desirable. The advertiser would take his own laboratory to the mine if desired. Proper references given. Inquire at this office. 3v157f

Workshop Surroundings.

There are but few workshops that may be said to be attractive in their surroundings. The majority of them are but dark and dreary places, where a stated stint of labor is performed according to a pre-arranged agreement; and when that agreement expires, or the stint is performed, then the stipulated price is paid. Beyond this there is but little in the majority of our workshops, and were it not for the daily calls of want, there would be no incentive to labor. We have seen workshops that were dark and damp, destroying the health and buoyancy of the spirits of the operatives, when a small sum, perhaps, would add not only light and warmth, but would fill the place with pleasant surroundings. By so doing, the morale of the workmen there employed would be improved, and, with improvement, much more work, and work of a better quality, would be produced. The surroundings of the workshop have more influence upon the operative than many are aware of. Give a mechanic clumsy tools to work with, a rough, dirty bench to work upon, an imperfect light to do the work in, and but little care exercised if he have proper ventilation and warmth, and he will become careless and heedless, and his work will partake of the surroundings in which it is performed. He will care but little if he ever completes his work or not, and perhaps his only thought will be that he gets his wages at a certain time. It is a general rule that he has no further care of his work than to get away from it as soon as possible when the hour of labor closes, and be as tardy as the rules will permit in commencing it in the morning. A few years of experience like this will spoil almost any mechanic for doing nice work, no matter how good a workman he may be. But give a workman good tools to work with and a nice place, suited to his wants and comfort, in which to perform his labor, and his work will be better done, and he will insensibly take more pains with it, than he will in a bad and ill-arranged apartment. In a pleasant room, he will, of his own accord, keep his tools and work in order, and will more cheerfully perform the task assigned to him. A kind of magnetic influence of the surroundings of the workshop will infuse itself into the operative, and his work will partake of that nature, and will go forth from his hands stamped indelibly with the impress of the influence thus created. If any doubt this, they have but to take a tour of but a few factories, and they will be convinced of the truth of the assertion. Where the proprietor of a shop commences a systematic order of arrangement of tools, for instance, by having a place for them and keeping them in their places, the spirit is soon caught up by the employes, and they insensibly have a system and order in their several labors. Their tools will be better made and better kept; more work will be done and of a superior quality. Order is said to be the first law of Heaven, and it ought to be the first law in the workshop and in all its surroundings.

Man is formed with a soul alive to the beautiful and a system of order; and it is only necessary that it should enter into all things except the workshop?—the place where thousands spend the best part of their existence. Why should not the manufacturer take some little pride in surrounding his shop with the elements of beauty, such as lawns and shade trees, as well as the mansion in which he lives? The shop is certainly the mine from which he draws his wealth, and might he not spare a small sum to make it attractive to others and to himself also? A few shade trees, planted at an expense of but a few shillings each, will soon be developed by Dame Nature into a cooling retreat from the heated walls of the factory when the work hours are over. A little disposition upon the part of owners in respect to the comfort of those who look to them for employment will create a tie of interest that will be reciprocal, and each will feel that the other is necessary to his support, and that they cannot well succeed if separated.—American Artisan.

MAGIC PICTURES are not altogether a new thing under the sun, although those known by that name and taken by modern photographers may be. The books tell us of magic pictures which, when viewed in a certain point through a lens, exhibit an object perfectly different from that seen by the naked eye. Nicoron tells us that he executed at Paris, and deposited in the library of the Minimes, a picture of this kind. When seen by the naked eye it represented fifteen portraits of Turkish Sultans; but when viewed through the glass, it was a portrait of Louis XIII! This is as wonderful as the stereoscope.

**HINKLE & CAPP'S  
CENTRIFUGAL ORE GRINDER AND AMALGAMATOR.**

Patent dated April 16th, 1867.

For Grinding and Amalgamating Charges of Ore.

Arranged as shown in the first engraving, the pan is adapted for grinding and amalgamating separate charges of ore of 500 lbs. each, doing its work rapidly, thoroughly and effectually.

For Grinding and Discharging Continuously.

Arranged as shown in the second engraving, all the interior grinding parts being the same as shown in first view, this pan is adapted for receiving and grinding and discharging continuously crushed quartz as fast as supplied by a five-stamp battery, with No. 4 or 6 screens. A "sluicer," or some similar contrivance, to carry off the clay, slime and surplus water, is to be placed between it and the battery.

Half Section or Top View.

**The Centrifugal Ore Grinder.**

This new GRINDER and AMALGAMATOR is extremely simple and compact in its construction. The principle availed of is entirely novel. The grinding is effected by perpendicular mullers, pressed laterally by centrifugal force against perpendicular iron dies, fitted to the inner sides of the pan. It is to be run at a speed of from 60 to 80 revolutions per minute, according to the hardness of the rock to be crushed. The pressure upon every part of the grinding surfaces is direct and uniform, and they wear with straight and true faces from first to last, conforming also to the shape of the sides of the pan, so that the work performed with old mullers and plates is as thorough and perfect as with new ones. The pulp enters readily between the mullers and side dies, the pressure being light in front and heaviest at the heel of the muller. There is no strain upon any of the parts, and no liability to breakage or disarrangement, and in wear except that which is useful on the grinding surfaces. The work done is performed without jarring, jerking, straining or clogging, with extreme regularity and evenness, the pulp being of great and uniform fineness. It is not liable to be clogged, nor to be obstructed, stopped, impeded or broken, by coarse pieces of rock, pebbles or iron, accidentally introduced with the crushed ore, as these can readily pass such mullers separately, without interfering with or affecting the other mullers, each of which is independent, or can rest upon the bottom below the mullers, without inconvenience, as the mullers play freely an inch above the bottom of the pan. It is more readily cleaned up than any other pan, as each muller can be lifted out separately by hand, and there is no necessity for lifting the revolving cone or driver, which is also easily turned, there being no friction when not in use, or rapid revolution. The bulk of the mercury is not ground up with the rock, but lies below the lower ends of the mullers in a groove, and in another groove on the cover of the pan, where all the pulp and metal passes continually over it without cutting or carrying it away. The mullers and side

dies are easily removed at any time, or when worn out, and an extra set of mullers is furnished with each pan sold. It is also adapted for grinding cement, sulphurets, roasted ores, etc.

We claim all these advantages for our Pan, and that it will do more and better work, with less power, and less attention and manual labor, more rapidly and with less expense, than any other pan or muller made for the same purposes, and is claimed to be of equal or greater capacity. We will sell them for use on condition that if, when fairly tried they fail to answer these promises, they may be returned.

For full description and illustration, see Mining and Scientific Press, June 15, 1867.

**Hinkle & Capp's Centrifugal Ore Grinder and Amalgamator**

May be seen in operation, and examined, at the European Metallurgical Works, on Bryant, between Third and Fourth streets, San Francisco, where all interested in mining and milling operations are invited to inspect it. Its weight, as arranged for continuous grinding and discharge, with extra set of six mullers, is about 2,700 lbs.; or as arranged for grinding and amalgamating single charges of 500 lbs. of ore, also with extra set of mullers, about 3,000 lbs. Price, as above, completely fitted and ready for use, either way, \$500, gold coin.

For further particulars, apply by letter to PHILIP HINKLE and CHARLES S. CAPP, No. 513 Clay street, below Montgomery, San Francisco, Cal. or personally to the above, or S. P. KIMBALL, Esq., at the European Metallurgical Works, on Bryant street, between Third and Fourth streets, or at the Miners' Foundry, First street, near Folsom, where they are manufactured.

Send for Circulars. PHILIP HINKLE and CHARLES S. CAPP, Patentees, 513 Clay street, San Francisco. 25v14-1f

**Portable Steam Engines!**

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes.

Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the remotest confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mills. For sale by TREADWELL & CO., 9v14-6m15p Corner of Front and Market streets.

WHAT MAKES A MAN?—A man never knows what he is capable of until he has tried his powers. There seems to be no bound to human capacity. Insight, energy, and will, produce wonderful results. How often modest talent, driven by circumstances to undertake some formidable looking work, has felt its own untried and hitherto unconscious powers, rising up to grapple and master it; and afterwards stood amazed at its own unexpected success!

Those circumstances, those people, enemies, friends, that provoke us to any noble or manly undertaking, are our greatest benefactors. Opposition and persecution do more for a man than seemingly good fortune. The sneers of critics develop the latent fire in the young poet. The anathemas of the angry church inflame the zeal of the reformer. Tyranny, threats, fagots, torture, raise up heroes and martyrs, who might otherwise have slept away slothful and thoughtless lives, never dreaming what splendid acts and words lay buried in their bosoms. And who knows but the wrongs of society are permitted by Heaven, because of the fine gold which is thus heated out of the crude ore of humanity?

Here is a truth worth considering. Are you in poverty? have you suffered wrong? do circumstances oppose you? are you beset by enemies? Now is your time! Never lie there, depressed and melancholy. Spend no more days in idle whining. Up like a lion! Make no complaint, but if difficulty fights you, roar your defiance. You know not what is in you. You are at school, that is your necessary discipline, poverty and pain are your masters—but use the powers God has given you, and you shall be master at last. Fear of failure is the most fruitful cause of failure. Stand firm upon the rock of your manhood, and in the end you shall not fail.

CURIOUS CUSTOMS.—M. De Chailu gives the following as a very curious custom which prevails among some of the native tribes in the interior of Africa: "When a person dies they cut off his head, and put it in a box, surrounded with clay or chalk, the whole of which is saturated as the head decays. The descendant of the deceased rubs his body with this clay or chalk, praying to his ancestor at the same time to give him luck. When he receives a guest, he goes to the place where the head of his relatives are kept, scratches a bit off the skull of one of his ancestors, and puts this bone powder in the dish intended for his friend, who having eaten of it becomes of one blood with himself, therefore must love him truly, open his heart and give him whatever he desires.

A NEW WATER COMPANY, to be known as the San Francisco Water Company, filed its articles of incorporation on Thursday last. Capital, \$6,000,000. The company proposes to commence operations at once, and will obtain their supply from some point in the Santa Cruz mountains; which supply is said to be equal to furnish a city with a million of inhabitants, even at the dryest season. Parties interested think they can bring water into the city within two years. Milo Hoadley, J. T. Boyd and John H. Turney are the Trustees.

To the Legal Voters of the City and County of San Francisco.

Prompted alike by a sense of duty to myself and to the public, and in compliance with the request of several hundred citizens, tax payers and friends of the Public Schools, representing the different political sentiments, religious creeds, nationalities and classes of the San Francisco community, I hereby announce myself an Independent Candidate, at the approaching election, for the office of Superintendent of Public Schools. In so doing, I deem it proper to say that I do not thereby appeal from the decision of any party or convention, but simply think it a matter of right, and, under existing circumstances, eminently fit to refer the subject of my candidacy directly to the people, the parties interested; and I think I may properly solicit, and with reason expect, the continued support of the friends of education, and that of all others who think I have faithfully and usefully discharged my duties during the past two years in the office to which I seek a re-election. I am induced to ask your support, and the more readily comply with the wishes of personal friends and the friends of Public Schools in becoming a candidate, since I am invited to do so "without respect to political considerations, which it is thought should be disregarded in the choice of school officers." Having devoted the best years of my life to the education of the young and to the interests of this city and the State in that connection, I feel it but just to myself and to the public which I have served, if success has attended my labors, that I should not be thrown out of a position of public usefulness and from needed employment, for no better reason than that another, however competent, wants my position, and seeks to be placed on it through preliminary political management and the discipline of a party organization. Such others as think with me in that respect, and believe a change of officers in the position I occupy is uncalculated for at the present time, and that my re-election would subserve the interests of the Public School Department of this city, are respectfully requested to give utterance to that effect by casting their votes for me at the approaching election.

Profoundly thankful for your generous support in a former election, I remain, respectfully,  
J. C. PELTON,  
San Francisco, July 29th, 1867. 5v15-5v

The Mining Press has entered upon its thirteenth volume. It is a valuable publication in its sphere, and its sphere is a large and important one.—[Marysville Appeal.

**HENDY'S LATEST IMPROVED CONCENTRATORS,**

**FOR GOLD AND SILVER ORES,**  
With Revolving Stirrers and Rotary Distributor.

Can be seen in Operation at the Union Foundry, First St., San Francisco.

**Directions for Operating Hendy's Concentrators:**

- The sulphurets are drawn off while the Concentrator is in motion, in the following manner:  
FIRST—Set the Pan, A, level, by its inner rim.  
SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.]  
THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.  
FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

The above directions, if followed implicitly, are all-sufficient. But, strange as it may appear, the proprietor has found that, in certain cases, they have, owing to the carelessness or to the ignorance of the operators, failed to serve as a complete guide. He, therefore, in the present edition of his circular, insists upon their being followed to the letter; and in order that there may be no mistake in future, he thus elaborates and explains them:

First, then: Unless the pan is level, it is out of the question to expect it to do its duty. One would imagine that the slightest possible examination of the illustrations would be sufficient to show this. Yet, in one case, where the machine did not work satisfactorily, it was found that no regard whatever had been paid to this point! The word level is in itself precise; it admits of no latitude, and cannot be misunderstood. Nothing is easier, to a mechanic, than to place the pan absolutely and mathematically level. It cannot be necessary to dwell further upon this point.

Direction Second, viz:—"Keep the pan about half full of sulphurets," has also, in some cases, been disregarded. A moment's reflection will point out its importance. The operation of the machine is such, that grains of any kind, whatever may be their size or weight, will seek the periphery of the pan, and unless discharged, will there remain, until other grains of greater specific gravity take their place. Of course, then, at the starting of the machine, and for a short time thereafter, the periphery will be partially filled with sand. It is therefore necessary to allow a quantity of sulphurets sufficient to completely occupy that space to accumulate, before the gate is opened, and their discharge commenced. It is obvious that they will otherwise be accompanied with more or less of sand. Once properly commenced, the discharge will be continuous. It must be regulated, however, by the richness, in sulphurets, of the pulp under treatment. A little practice will enable the operator to gauge it without difficulty.

After what has been said, direction Third requires no further explanation. Direction Fourth is, to a mechanic, sufficiently explicit.

These concentrators can be set in pairs, for which a single crank shaft will suffice. Two such pairs can be so arranged as to require a driving shaft of only six feet in length. The guaranteed capacity of each machine is five tons every 24 hours. Eight tons, however, can be and has been put through in that time. The small proportion of sand which the sulphurets carry, when thus rapidly concentrated, is not an objection but rather an advantage, in case the operators themselves intend to work them. Either in roasting or in pan-working, a small admixture of sand is unquestionably an aid. But if the sulphurets are being prepared for sale, they must of course be clean. In this case, the discharges from four machines can be conducted into a single additional one, and the concentration thus be made complete.

The proprietor has recently still further improved the machine, by the substitution of an iron frame for the former wooden one. While nothing is added to its weight by the change, it is thus made stronger and more compact; and at the same time the labor of setting it up is considerably lessened. He flatters himself that these added advantages leave nothing further to be desired as regards the perfecting of the machine.

**NEW YORK, JAPAN AND CHINA.**  
LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.  
On the 10th, 18th and 30th of each month that has 30 days.  
On the 10th, 19th and 30th of each month that has 31 days.  
When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.  
Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.  
Departures of 18th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.  
Departure of 10th connects with English steamer for Southampton and South America, and P. R. R. Co's steamer for Central America.  
The following Steamships will be dispatched on dates as given below:  
August 10th—CONSTITUTION.....Capt. Jos. Sutton, Connecting with OCEAN QUEEN, Capt. Conner  
August 19th—SACRAMENTO.....Capt. J. M. Cavarly  
August 30th—MONTANA.....Capt. E. S. Farnsworth  
Connecting with ARIZONA, Capt. Murray.  
Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.  
An experienced Surgeon on board. Medicine and attendance free.  
These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.  
Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—If desired an amount of £10 to £20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.  
For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.  
The Steamship GREAT REPUBLIC, Capt. S. Deane, will be dispatched September 3d, at noon, and will be followed by the CHINA, Capt. George H. Bradbury, October 14th, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONKONG, connecting at Yokohama with the steamer COSTA RICA, for SHANGHAI.  
For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorf streets.  
**OLIVER ELDRIDGE, Agent.**

**To Photographers!**  
**NITRATE OF SILVER.**  
Messrs. Falkenau & Hanks—Gents—We have used the Nitrate of Silver manufactured by you, and find by actual experience that it is, in every respect, equal to the best makes we have used heretofore, both for sensitizing paper and the Silver Bath. Yours, **READLEY & RUFUSON,**  
Photographers, 429 Montgomery st.  
Messrs. Falkenau & Hanks—Gents—I have subjected the sample taken from your Nitrate of Silver to a thorough analysis, and find it to be chemically pure, not containing the slightest trace of Impurities whatever.  
Respectfully,

illustrate in our columns inventions having for their object improvements and modifications of agricultural labor. We are enabled in the present issue to describe one of these useful inventions, designed to supply machinery to a most tedious and important part of the farmer's labor. This machine has been highly spoken of at the East, and is known as

### CONOVER'S PATENT POTATO-DIGGER.

This invention consists in an inclined carrying wheel so combined with the share or shovel plow of a potato-digger as to convey the potatoes back and upward from the plow preparatory to depositing them upon the surface of the ground in the rear of the machine. The carrying-wheel is constructed

which is supported by means of a transverse axle, upon which are two drawing-wheels, which communicate a rotary motion to the axle by means of pawls attached to the wheels and ratchets secured to the axle. The rear end of the main frame of the machine is sustained by two castor-wheels. A supplemental frame is connected with the main frame by upwardly-projecting braces, which pass through holes in the main frame in such a manner as to hold the supplemental frame in a parallel position with the main frame, and the supplemental frame is also braced against the backward strain exerted by the action of the shovel-plow.

The shovel-plow, B, Fig. 2, is made with two forward projecting share-points, A, A, and is firmly attached to the forward end of the supplemental frame. Secured to the lower end of an inclined shaft and just be-

square and passes through a square slot formed centrally in a bevel pinion, the circular hub of which is fitted into a suitable bearing formed in an arm fixed upon the main frame; the shaft is thus left free to move up and down, as the supplemental frame is raised or lowered, without interfering with the rotary movement of the pinion. This bevel-gear receives its motion from a larger bevel-wheel, to the shaft of which motion is communicated from the rotating axle through the agency of two intermediate spur-wheels. Secured upon the supplemental frame is a screen-guard, D, which extends across the wheel, C, and effectually prevents the dirt from passing to the opposite side of the wheel. Another screen-guard, E, extends from the shovel-plow around a portion of the circumference of the carrying-wheel, C, preventing the

potatoes from being thrown off by the rotation of the wheel, and at the same time allowing the escape of the dirt. At F is a vertical plate of steel, which acts as a scraper to keep the wheel clean, and at the same time discharges the potatoes and vines from the wheel, C, and throws them upon the screen, G.

Projecting downward from the supplementary frame, over and beyond the points of the shovel-plow, are two deflecting arms or colters, the office of which is to turn or deflect inward the potato-tops or vines, so that they will pass over the central part of the shovel-plow to the carrying-wheel without clogging the action of the machine.

As the machine is drawn along over the field to be dug, the shovel-plow passes through and under the row of potatoes at any required depth sufficient to take up all the potatoes, which, together with the vines and dirt, are carried back from the plow and fall upon the carrying-wheel, C, and are carried between the guards, D and E, to the shaking screen, G, from the rear of which the potatoes fall to the ground. As the machine passes along, the greater portion of the dirt mingled with the potatoes as they pass from the shovel-plow is shaken through the openings

of the carrying-wheel, and what remains with the potatoes after passing to the shaking-screen, G, is effectually shaken from them through the spaces between the bars of the screen.

The working of the machine is completely under the control of the driver, and the shovel-plow can be set to work at any required depth, or raised out of the ground so as to clear any obstructions, such as rocks or stumps. It is claimed that this machine will take out from three to four hundred barrels of potatoes per day, and leave them clean and on the top of the ground ready to be gathered up.

This machine has been patented by S. B. Conover, of New York City, and was first illustrated and described in the *American Artisan* of March 28th, 1867.

ONE of Paine & Stevens' separators has been put up to work tailings for the Gould & Curry mill, Nevada. The Virginia City *Trespass* says its success is such that two more are to be built forthwith.

CONOVER'S PATENT POTATO-DIGGER.

with radial teeth or arms, so that the dirt may be sifted or separated from the potatoes previous to their leaving the machine. Suitable guards or fenders are combined with the carrying-wheel, whereby its most efficient operation in carrying the potatoes from the shovel-plow is secured.

Fig. 1 represents a perspective view of the machine, and Fig. 2 is a horizontal section, showing the principal working parts of the apparatus. The machine is constructed with a horizontal main frame,

bind the shovel-plow, B, is the carrying-wheel, C, the upper surface of which is made convex in form, with radial teeth or arms. A screen, G, is suspended immediately behind the carrying-wheel, C, the forward edge of which extends a little distance under the edge of the wheel. A shaking motion is communicated to the screen by means of a crank and pinion, H, turned by a toothed rim formed upon the under side of the carrying-wheel, C; the upper portion of the carrying-wheel shaft is made

## Agricultural Inventions.

Numberless are the machines which the inventive genius of the last twenty years has supplied for heavy operations in agriculture, as substitutes for human hands and muscle; and in no part of the world has activity in this direction been more successful, or accomplished more for the purpose intended, than on the great prairies of the Mississippi Valley. Some of the most wonderful results of human ingenuity have been displayed in these inventions. The fame of our reapers, our thrashers, our cultivators of various kinds, etc., has become world-wide, and their value in adding stimulus to the great leading industry of agriculture is beyond human calculation.

The work of the inventor has not only blessed the farmer by rendering his labor easier, but it has also enabled him to find leisure, by a reduction of bodily exertion, for storing his mind with useful knowledge, and thereby taking a higher rank in the scale of humanity.

Without the aid of machinery it would be utterly impossible to cultivate and gather in the immense crops which are now being produced in our extensive agricultural districts. Without such aid we should be compelled to either reduce our crops at least one-half or double our agricultural population, and at the same time increase, in like ratio, the cost of our leading agricultural productions. It is only by the aid of machinery that we can carry our breadstuffs to foreign markets. The superior intelligence of our people, by which we are enabled to bring the arts and sciences more fully to bear than can the less intelligent agricultural classes of other nations, is what enables us to supply the markets of Europe and Asia with the products of our soil.

It is only by reflections such as these that we are enabled to form anything like a proper estimate of the value of agricultural inventions to us as a people. Agriculture is the great interest upon which all other interests are based: and as ours is mainly an agricultural people, it becomes highly important that we should keep fully posted with regard to such improvements, and study well their significance. We shall endeavor to make the *PRESS* useful in this direction whenever opportunity offers; and to this end it is that we from time to time

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

(Written for the Mining and Scientific Press.)

## The Paris Exposition.

BY A. S. HALLIDIE.

## A STEAM BREAD BAKING APPARATUS.

Among the many things which the Paris Exhibition has produced, the machinery for baking bread by steam attracts much attention, and is being examined into by the French Government as to its adaptability for the use of armies on the march. The apparatus consists of a long oven, surrounded by a number of hermetically sealed, wrought iron pipes, half charged with water, and of about  $1\frac{1}{2}$  inch bore, with a fire grate at one end, by which the water in the pipes is heated. The oven itself is of plate iron, having its door at the other end, and is heated in ninety minutes, ready for baking. It is always free from dirt, makes no smoke, requires very little fuel, is evenly heated throughout, and for army or other portable uses, is set up on a suitable carriage frame. The cost of the apparatus, complete on wheels, is about \$1,200.

## A SMALL TELEGRAPH APPARATUS.

I saw a very pretty telegraph machine, for private telegraphy, more especially, occupying a space of about 15 by 18 inches, and weighing about 40 lbs. The letters are arranged in the same manner that a compositor arranges his type—those more frequently used being conveniently together; but in a circle. The keys are like the stops or keys in a concertina. One of these machines has been working very successfully for some time past, at the London District Telegraph office, printing the message on a long strip of paper, and requiring no attendance to receive. It is the invention of Mr. Thompson, and has been improved by Mr. P. B. Jones, who has overcome some difficulties of polarization.

## MALACHITE AND EMERALDS.

A very pure block of malachite, exhibited by Russia, finely polished in places, and weighing about 4,500 lbs., is very attractive; as also is a very beautiful specimen of emerald in rock, which is about two feet high, and dotted over with emeralds. This latter is exhibited in the British department.

## IRON MANUFACTURES.

In French iron manufactures, the Chatillon and Commentry company has a variety of large samples of its make—a piece of rolled iron about 110 feet long, 9 inches high, with upper and lower flange 3 inches wide, web 1 inch thick; also a piece or section 15 feet long, 3 feet high, 12 inches wide at upper and lower flange,  $1\frac{1}{2}$  thickness of web, and rolled to a curve of 300 feet radius; a plate weighing about 7 tons, 14 feet long, 37 inches high and 8 inches thick.

The Creusot Co. also exhibits many samples of its iron work, but not of quite so large dimensions.

Peter Gaudit & Co. exhibit similar pieces of workmanship, and among the display is an ingot of steel, weighing 25 tons, which shows the grain admirably, by being broken across the middle, as well as the beauty of surface of polished parts.

These three exhibitors produce nearly one third of all the iron in France. The Creusot Co. employ 10,500 men; the Chatillon and Commentry Co. employ 8,900 men, and Peter Gaudit & Co. employ 7,500, making 26,900 in all. The Creusot turns out one-eighth, the Chatillon one-twelfth, and Gaudit one-ninth, of all the iron made in France. These firms have lately turned their attention very much to this manufacture, and they are now readily able to roll girders thirty feet long, for heavy bridge work. They also roll girder iron with two flanges, and an additional web above upper flange, almost any size required.

In the French department there are also

exhibited a great many specimens of statutory work, cast in iron, and without retouching. It is really extraordinary how successful they have been in producing these figures in the rough; showing a nicety of molding and perfection of casting which would do credit to any piece of work, with a simple, plain surface; nor do they experience any difficulties attending the successful casting of human or animal figures. Here are groups of animals and of men, in all positions and of all dimensions, drawn from the mold and exhibited, having simply the sand knocked off, which equal many of the finished works I have seen in Paris or London. Mr. Durenne, of Paris, can well be proud of his work, for it really deserves the praise bestowed on it, and forms an important feature of the Exhibition. All the figures exhibited are each cast in one piece.

In big gun work, Krupp, of Essen, has a fine display, as also in large and heavy steel work, showing what can be done on a large scale, when the machinery and appliances are properly arranged, and of sufficient magnitude. There is much difficulty in obtaining admission to these large works, especially by foreigners; but in conversation with a gentleman familiar with the firm and its works, he accounts for the great success of Krupp's steel, more in the rapidity of manipulation, pouring, etc., than to any specially secret mode of treatment, except in the process of annealing, where, I understand, the black oxide of manganese is employed.

During the Luxembourg difficulty, when every one was looking for war between France and Prussia, I remarked, in passing the big gun of Krupp, that it might serve a purpose to the French it was never intended for. My friend (who was a German) suggested that it would be equally convenient for Prussia to find it there on her arrival. However, the Luxembourg difficulty is happily over; and it is to be hoped that the big gun will be stared at and used for no other purposes than those of peace.

## THE DISPLAY OF ARMS.

The British display of arms, sent from Woolwich Arsenal, is very fine. Every thing is there shown you and explained by officers sent over for the purpose; and there is a different spirit shown by the British about their arms, from that exhibited by the French, who have all their weapons in a building by itself, of which you are allowed only to peep in at the door. Whether they are afraid one may steal the guns, or fear that it would be an *expose*, rather than an exhibit, if they allowed the public to pry too closely into these things, is a matter of conjecture. It is a subject of common remark, that Great Britain shows a remarkable confidence in her strength, and her ability to keep up with European nations in the improvements of the age, in defensive and offensive weapons; or else her magnificent exhibition of firearms is a piece of indiscretion and bravado. I am inclined to the belief that, although her exhibition shows a large proportion of guns as far advanced as most, if not all, the European nations; yet they are sent there from the fact that they are more useful for exhibition than for any other purpose; that is, that the expensive experiments, lately made by the British Government, have justified it in letting these guns go on exhibition, having guns of later manufacture, more effective and useful. Great Britain has not failed to take advantage of any practice adopted by the United States, and to improve on it to the best of her ability.

In the manufacture of iron plates, for defensive purposes, Great Britain does not seem to be ahead of France or Germany; but she has so far succeeded in piercing any plates produced—and the contest still lies with the shot a little ahead; although, looking at an 8-inch steel-faced plate, solidly backed, one naturally doubts the possibility of piercing it under ordinary circumstances. In the British arms department, and in other parts of the exhibition, there is, however, too much tangible evidence, in the shape of 8 and 10-inch solid iron pierced by ball, to doubt the possibility of penetrating almost anything.

Every European government seems to be fully alive to the necessity of being well posted on the most improved mode of firearm, and iron-clad defences; and although we do not show much of this kind of thing at the Paris Exposition, it is certain that but a very short time since we had a more serious exhibition of our own; and one in which the minds and muscles of men were bent to their utmost tension, in perfecting these very things, which now attract so much

attention at Paris. Our experience struck the key note, which soon rang with alarming clearness through the various nations of Europe. And, though our experiments were those of the necessities of war, and were made during its conflicts, yet results go far to prove that they are now the starting and stopping points of the experiments of peace. The recollection of these facts, with their practical teachings, are best exemplified by the various efforts of European nations, as exhibited at Paris, and the almost entire absence of this class of exhibits from the United States—however much to the regret of those in the old world, where curiosity would have been satisfied, if nothing more.

**GEOMETRICAL QUERY.**—The following geometrical query has been handed us for publication. Will some one furnish us with the solution?

*Given.*—The area of the segment of a circle—*a*. Also, the cosine (the perpendicular distance from the center of the chord to the center of the circle)—*b*.

*Required.*—The radius *R*, in terms of *a* and *b*—that is, a general formula for finding the radius or height.

**THE BOSPHORUS TO BE BRIDGED.**—A movement is on foot to bridge the Bosphorus. The designs of the work have already been prepared by Austrian engineers. The bridge will measure 3,360 feet in length, and will rest on two pillars, one of the arches being 1,207 feet, and the two others 1,026 feet. The cost is estimated at \$4,200,000. This is one of the natural barriers in the track of the great highways of the world, which must, sooner or later, yield to the triumphs of modern engineering. The Bosphorus, the Mississippi, the Straits of Dover, the Isthmus of Suez and of Panama, the Alps, the Rocky Mountains and the Sierra Nevada, are but a few of the many great natural barriers to intercommunication and the ready exchange of commerce, which must yield to the skill, enterprise and industry of man. All such works are but so much toward the fulfillment of the saying of the prophet of old, who wrote: "Every valley shall be filled, and every mountain and hill shall be brought low; and the crooked shall be made straight, and the rough ways smoothed." Verily, we live in an age of progress.

**THE WOODEN WALLS OF ENGLAND.**—England has lost confidence in her wooden walls, and is selling off her old line warships to private parties, for conversion into peaceful merchantmen. Five line of hattle ships and five first-class frigates were recently sold for \$340,000, the first cost of which was \$10,000,000. Several of them were steamers, in which the boilers and machinery were still in good order, and the average use of the entire fleet was a little over twelve years. A portion of the number will be broken up; others will be converted into merchantmen. Thus the proud supremacy of England's wooden walls is fast falling before the monitors and iron-clads of America; and the rebellion in which she rejoiced as the probable means of our destruction as a power on the earth, has, by a righteous retribution, resulted in the production of an instrument for her own humiliation.

**THE FUTURE OF EDUCATION.**—Our former traveling correspondent, "W. R. B.," now occupying a professor's chair, writes us as follows: "Our college is progressing slowly, as do all such institutions at the west. For my part, I am fully satisfied that State institutions must and soon will take the place of our present colleges and all private schools; and that knowledge, flowing free and costless from the munificence of the commonwealth, will be the common heritage of the poor and rich alike. Then, and not till then, will the superiority of practical and scientific instruction over the jargon of the dead languages, be fully comprehended, and the true position he awarded to those who have devoted their lives to improving the condition and character of the human race."

## The Philosophy of Eggs.

The structure of the eggs of birds offers a certain resemblance to some forms of the galvanic battery, inasmuch as they consist of a fluid enclosed in a porous diaphragm, and in contact with another fluid of a different composition. This circumstance, attracting the notice of Dr. John Davy, he made it the subject of more careful experiments, in order to ascertain whether any galvanic action was exerted by the different constituents of which the egg is composed. The result of his experiments fully justified his expectations, and established the fact that electro-chemical action plays no unimportant part in the changes which the egg undergoes during the process of incubation. He found that this action was sufficient to deflect the needle of a delicate galvanometer fully five degrees, and that in changing the wires the needle was reversed.

Dr. J. V. C. Smith has recently delivered a very interesting address before the American Institute, at New York, on the "Structure of Eggs," which was listened to with great attention, and which contains a statement of many facts which are both new and interesting. The Doctor remarked that in one sense it might be said that all animals, from the mole to an elephant, are the product of an egg, though there are many varieties. In poultry, no food can add to the number of eggs, for they are created with life itself, and lie in an embryotic state. Scraps of meat and like food only furnish the material which forms the fluid part of eggs in the winter season. Young birds, when fed on worms, grow faster for a few weeks than they afterward do when they get grain or seeds.

Dr. Smith then showed a vertical section drawing of an egg, with the germ as a speck on the upper side of the yolk. From the two poles of the egg, what amounts to a cord runs through the center of the yolk, and holds it suspended in the white. In turning the egg, this cord may be twisted any number of times, and yet, such is its nature, that the germ will always be on the upper side. Philosophers have repeatedly tried to make the germ lie on the lower side of the yolk, but they found it impossible. In hatching, the bird turns over the egg frequently, that the white may be equally warmed; but the germ always will be nearest her body.

The eggs of fish also are constructed in this manner, that they may have the advantage of solar heat. The eggs of the skate present some wonderful features, for the cords are so constructed that if they tip over in a storm the heat of the sun will shrivel the side most exposed, when the egg will right itself and get the solar heat.

Around the germ of the egg the white is collected, and forms the body of the bird. A short time before the bird is hatched there is a hole in its breast, and at a particular period the yolk enters into this hole, with a species of spasm, when the orifice rapidly heals over. Then on the end of the bill there is a little sharp horn, which the young bird uses to crack the shell, and to open its way into the outside world. Being no longer of use, it soon drops off.

Now this yolk contained within the crop and body of the young bird, is to furnish it with the nutritious food most proper for it. More than this, it is blind; but, when the yolk has been consumed, then its eyesight is established. The parent is aware of this fact, and at first does not seek for food; but so soon as she thinks its store is exhausted, she scratches, a little at a time, and when its young can see, it will pick up with the bill what is provided. We should be taught by this that great harm can be done by giving food to young chickens while the yolk yet remains in their crops; and perhaps we now understand why so many die young.

**PLASTER OF PARIS**, when mixed with alnm, forms an excellent cement for use in the laboratory and elsewhere. The mixture is an old one, but well worth being occasionally recalled to mind.

**ALCOHOL FROM THE JERUSALEM ARTICHOKE.**—It is said that the juice of these roots, when properly fermented, will yield from eight to nine per cent. of concentrated alcohol.

## Mechanical.

## Hydraulic Presses.

Hydraulic presses are sometimes put to most severe tests. In the manufacture of lead pipe, for instance, it is often necessary to raise the pressure as high as three and three and a half tons to the inch! When this high pressure is reached, great inconvenience is caused by the water passing through the pores of the iron, and appearing like a dew upon the outside of the presses! It has also been observed that the iron is very rapidly deteriorated by this great pressure. This deterioration has been (and no doubt correctly) attributed to the oxidizing action of the water on the interior of the iron during its passage through the pores—the iron becomes gradually oxidized throughout its entire mass, and thereby loses its tenacity, and the presses finally give out.

This same effect has been observed in Bissell's patent air springs for car buffers, etc. The air is forced into these springs under great pressure, sometimes as high as two tons per square inch. The air, under this great pressure, leaks out—probably through the pores of the metal. This passage of the air through the walls of the cylinder appears to have the same effect on the texture of the iron as the ordinary atmosphere does upon the outside of the same, producing a gradual oxidation and consequent weakening of the tenacity of the metal—the same as already noticed in the case of water.

Various experiments have been tried to obviate this difficulty. The metal has been saturated with beeswax, under hydraulic pressure; melted iron has also been tried, as well as various alloys supposed to be less porous than ordinary cast iron. These experiments have all proven more or less beneficial. But the Messrs. Weems, Engineers, near Glasgow, Scotland, acting upon the well known fact that copper is, to all practical purposes, impervious to liquids, or, at least, much more so than ordinary cast iron, conceived the idea of lining their hydraulic cylinders intended for great pressure with that metal. The experiment succeeded admirably. They have used hydraulic cylinders so manufactured for making metallic pipes for several years, without observing any leakage, as heretofore in cast iron, and without any apparent deterioration in the tenacity of the metal composing the cylinders. The indications are that they will continue to work indefinitely. They are using a 33-inch copper-lined cylinder, with a pressure of  $3\frac{1}{2}$  tons to the inch, without any inconvenience; when a pressure of from two to two and a half tons would be the most that an iron cylinder, without the inside copper lining, would bear, and under which an iron cylinder would leak badly, losing a large amount of power, and soon giving out from gradual deterioration, by causes already noted. A very thin copper lining prevents the passage of the water into the pores of the iron. The discovery is one of much practical value.

**A SUBSTANTIAL BUILDING.**—The early builders are noted for the substantial nature of their structures. Witness the ancient Roman, Grecian and Egyptian ruins—especially the pyramids built by the latter. Herodotus, the father of history, tells us of a building connected with the temple of Sanota at Buto, the four walls of which were hewn out of a single rock. The building was in the form of a cube, the superficies of each side of which measured 58 feet eight inches in every direction. The covering of this remarkable structure consisted of a single block, five and a quarter feet in thickness! Can any of our modern engineers tell us how such a rock could be split out and moved into its position by any of the appliances of the present day! The room itself was a square shaft, 58 feet eight inches on each side, sunk to the same number of feet in depth into the solid rock. The rock probably stood above ground.

**WATER POWER vs. STEAM.**—Water power is considered superior to steam for many purposes, especially such as require great delicateness of manipulation. The steam engine unavoidably imparts, with each of its impulses, an eccentric *jerk* to the machinery it moves, which is often found extremely troublesome, particularly in grinding wheat and in spinning very delicate thread. In the broken grain of wheat it is found to create an unevenness in the size of those millions of particles that go to make up a very minute quantity of flour, which often seriously affects the bread. The same fault appears in the delicate thread, by which a coarse and uneven texture is given to the cloth. Still, so convenient and so universally applicable is steam, that it is often found successfully competing with water, side by side. If the principle of the rotary engine could be made to work, on a large scale, with no more drawbacks than are connected with the reciprocating engine, it would doubtless be found far more serviceable than the latter, and would not be attended with the difficulties alluded to above.

**FOUNDATIONS OF HOUSES.**—Too little attention is paid to the foundations of houses. One of the greatest mistakes most generally made is setting them too low. The consequence is the house is damp, and the lower timbers and floor soon rot out. It is rarely the case that a house is set too high. A person inexperienced in building levels up his sills, and if there be a low place on one side it looks quite formidable for either filling up or underpinning. In the country, a house should, if possible, be so set that the water will run from it on all sides, and run quite away from it. One who has had considerable experience in this matter gives a rule like the following: "Place the sills as high as you think they ought to be, and then raise them a foot higher, and you will have them nearly as high as you will wish you had raised them when your house is finished. We have never known a person to wish his sills lowered who followed this rule. No external costly finish, elegant front yards, or any other contrivance, can atone for a house squat on the ground. It is well to cultivate habits of correct taste, even in our humblest dwellings. In other words, it costs no more to do a thing right than to do it wrong."

**AN "IMPROVEMENT" GIVEN UP.**—When the Paris Exhibition was first opened, an English firm in the English department exhibited what was called on the label "An improved Corliss engine." Soon afterwards a genuine Corliss engine was set up in the United States department. This genuine machine, built at the Corliss Company's works, in Providence, R. I., had been running but a few days before the label of the "improved" Corliss in the English department was taken down. The builder of the English improvement has since concluded that he shall hereafter confine himself to building the *unimproved*, plain Corliss engine.

The largest gate in the world has been constructed for the Sanlt St. Mario canal, at Newport, thirty-five miles above Detroit. It is 82 feet wide, (that being the width of the canal,) 21 $\frac{1}{2}$  feet deep, and 32 inches thick. The timber used for its construction, cut into inch boards, would measure 120,000 feet. There were about 40 tons of iron used in its construction. It was built and put together at Detroit, afterwards taken apart and transmitted in pieces to its place of destination.

**WELDING IRON.**—M. Liétar, of Brussels, has described a new method of welding iron or steel, or iron with steel. He calcines and reduces to a fine powder, one kilogramme of iron or steel filings, 100 grammes of sal ammoniac, 60 grammes of borax, and 50 grammes of halsam of Copaiva. One of the pieces of iron or steel to be soldered is brought to a red heat, and after being cleaned with a wire brush, the powder is spread upon it, and the other piece of metal, at a white heat, is brought in contact with it; thus a perfect welding is effected.

## Scientific Miscellany.

## Recent Lunar Discovery.

We have already made several notices of recent lunar observations, developing some important facts with regard to the moon's physical condition, and which appear to be quite at variance with the ideas that have heretofore prevailed. These observations have reference to some undoubted changes which have lately taken place in the volcanic crater known as Lüne. This crater is familiar to most lunar observers, and has heretofore exhibited all the characteristics of other lunar craters. These former appearances and the recent changes are noted as follows by Dr. Schmidt, of Athens, who was the first to note the phenomena, and establish the fact that active volcanoes still exist on the face of the moon. We copy from the *New York Journal of Commerce*:

When seen at the moon's quarter, with the sun's rays striking the side of the crater at an angle of forty-five degrees, the shadow of the elevated edge is distinctly shown inside of the hollow, and can be traced as it passes along the bottom of the crater. By means of delicate micrometers, the dimensions of this shadow can be measured, and from these known data and the angle of the sun above the lunar horizon, it is easy to calculate with great accuracy the depth of the crater and the height of the peak above. By these methods measurements were obtained by Beer and Madler of nearly 2,000 lunar mountains, from which it appears that they are much higher than the Alps and Appenines, on the average, and that thirty-nine of the number would overtop Mont Blanc. The craters are incomparably larger than any we have on this earth, several of them having a known diameter of over 100 miles, and a depth of two or three miles.

In the early part of this year the astronomer to whom we have alluded, directing his gaze at the crater of Lüne at the best moment for its observation, was surprised to find that it no longer presented the crater-like appearance. The familiar black shadow thrown by the lofty and ragged edge into the enormous hole beneath was not visible, but instead the whole crater disclosed the smooth bright surface of the flat portions of the moon. The same remarkable phenomenon was observed soon after by Father Secchi at Rome, and Mr. Birt of England, and is explained by all of them by the hypothesis that Lüne has indulged in an eruption and filled up its crater (about five miles wide) to the brim with lava. Later observations have brought to light a black point in the center of the site of the old crater, which proves to be a mountain about 2,000 feet in diameter, but not over 100 feet high.

These phenomena have been observed through glasses with magnifying powers of not over 800 diameters, and, corroborated as they are by skillful and cautious observers, must be accepted as facts, proving quite conclusively that the lunar volcanoes are not yet extinct, and thus overthrowing at once the favorite speculative theory of the schools, that our satellite is only an enormous graveyard of defunct energies. It is premature to suggest any explanations as to the full significance of this discovery. It certainly will have the effect of interesting many people in lunar affairs who have hitherto confined their thoughts and desires to the planet upon which we live. As ardent and intelligent observers are multiplied, especially if they work together as moon committees, we shall soon come to know pretty accurately what is going on in our soft satellite, and occasionally get our bulletin of news about it (if not from it), which will be quite as accurate we dare say, as some of the terrestrial intelligence telegraphed from the other side of the Atlantic.

**A WINTER LANDSCAPE.**—In Germany materials are put up and sold for making an interesting chemical experiment. They consist of a solution of nitrate of lead, one part; and water, three parts; also of sal ammoniac (chloride of ammonium) in fragments of about the size of small beans. The solution, which is a colorless liquid, is poured into a bottle or glass to the depth of, say, two inches, and then pieces of sal ammoniac are dropped in to cover the bottom. A double decomposition takes place, and a white crust is deposited, forming miniature representations of trees, grasses, and rocks covered with snow. Those who intend to repeat the experiment must bear in mind the fact that the nitrate of lead is poisonous.

**COMPRESSION AND EXPANSION.**—A remarkable instance of the heat resulting from compression and the cold from expansion, is observable in the action of the air tubes employed in long tunnels, for conducting compressed air for driving machinery, as in the Mont Cenis and Hoosac tunnels, and other similar works. The *Mechanics' Magazine* for March, in noticing a similar arrangement at the Ballarat Tunnel, in Australia, where compressed air is thus used in the interior of the mine to drive a pumping engine, and for ventilation, says that the heat is so great for the first 500 feet of pipe, next to the condensing pump, that notwithstanding the pump works within a jacket of running water, the pipe is nevertheless as hot as the steam pipe connecting a boiler with the steam chest of the engine, while on the other hand, the escape-pipe from the air-engine within the mine, is *bearded with icicles*. In addition to the interesting illustration which this affords of the calorific results from compression, and the frigorific consequences of expansion; it also reveals a serious loss—the power equivalent of the heat wasted. Were it not for the incidental advantage derived from the fresh air so introduced into the mine, this mode of operating machinery would be found, from this loss alone, too inferior, to the more common methods of transmitting power to come into general use.

**DIAMAGNETISM** is a term applied to a class of substances which, under the influence of magnetism, take a position, when freely suspended, at right angles to the magnetic meridian—that is, point east and west. M. Chautard, professor of natural philosophy at the faculty of sciences at Nancy, has recently sent to the Academy of Sciences a paper on certain experiments of his relating to the magnetism, and diamagnetism of gaseous substances. He uses a large Ruhmkorff's electro-magnet, arranged for Faraday's experiments, and excited by from twenty-five to thirty Bunson's elements. Taking Plateau's mixture of soap-suds and glycerine (our readers recollect Plateau's liquid membranes, forming polyhedrons with liquid faces), and blowing it through a pipe, so that the bubble formed on one of its extremities may be above the pole of the magnet, at a distance of from two to three millimetres, while at the other extremity of the pipe there is a bladder filled with oxygen, from which that gas may be supplied to the bubble, M. Chautard casts a quantity of light from an oxy-hydrogen lamp on the bubble in question, which then moves to and fro like a magnetic pendulum, its oscillation having, under these circumstances, been seen by upwards of three hundred spectators.

**DRAWINGS ON POLISHED AGATE.**—The curious figures sometimes found on agate may be imitated by drawing the design with a common goose-quill, wet with a strong solution of urate of silver, and exposing it to sunlight. At first the color will be brown, but if retouched two or three times, it will become reddish. If the solution contains one-eighth of common soot and one-eighth of bi-tartrate of potash, it will give a greyish brown color. A violet color is obtained by substituting alum for the two substances last named. A solution of chloride of gold gives a light brown color, and nitrate of bismuth white and opaque appearances. These colors are unaffected by the atmosphere; they will reappear after washing when exposed to sunlight.

**SUGAR IN MUSCLE.**—Dr. Ranke of Munich, has by recent experiments confirmed the discovery made by Meissner, that a true, fermentable sugar exists in the muscle, which is increased by muscular action, (tetanization caused by strychnine or electricity,) and further that the liver has no effect in causing this increase, for the sugar is proved to arise in the muscle itself, and not from muscular substance.

**NEW DYES.**—Messrs. Girard and De Laire have obtained a patent in France for extracting three new dyes from the black residuum formerly thrown away in the manufacture of rosaniline.

## Contributed for Our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

175.—From the Star Spangled Banner mine, three miles from Nevada City, Cal. Dark iron-gray quartz, with fine sulphurets in irregular layers and spots. A specimen of the general character of the ore.

176.—From the same mine, is exceedingly rich with fine gold, so thickly interspersed that the precious metal predominates in a considerable portion of this sample of ore. It is from a new development in the mine, which was noted more particularly in our last issue.

177.—From the Nevada Quartz Mining Company, one mile below Nevada City, on Deer creek. This sample is composed almost entirely of heavy sulphurets, whitish, gray and yellow, with white quartz and galena and probably antimony. These sulphurets are said to sometimes assay \$400 per ton, and work, on an average, by chlorine process, \$150. Wm. M. Ratcliffe is Superintendent of the mine, which was located in 1851, and is now worked with a 12-stamp mill. Four of the stamps weigh 1,000 pounds each.

178.—From the Wyoming ledge, located just below the Nevada mill, mentioned above. Mostly sulphurets, soft, and very much decomposed.

179.—From the Empire mine, Ophir Hill, Grass Valley. Light-colored quartz, thickly spangled with sulphurets. This mine and mill will be more fully noticed in another issue.

180.—Sulphurets from the Eureka mine, 1½ miles from Grass Valley. Deep yellow color, yielding from \$300 to \$400 per ton by chlorine process. Further notice of this mine will be found in a future issue.

**IMPORTANT DEVELOPMENTS IN DEL NORTE COUNTY.**—The superintendent of the Hanscom Copper Mining Co. has recently discovered that the croppings of that mine consist of decomposed auriferous mundie, quite rich in gold. Some two tons of this mineral, which was recently sent to this city, has been worked in small lots by different parties, with very satisfactory results—although the working processes do not come near up to the assay. In opening the mine, some four years since, the miners went down in this mass of decomposed mundie some ten feet, when they struck copper ore of such richness as to warrant the running of two tunnels to strike the vein—one at 160 and the other 400 feet in depth. The upper tunnel has reached the vein, and developed a three or four-foot copper vein, carrying on each side several feet of mundie, evidently identical with that from which the decomposed gold bearing mineral on the surfaces must have been derived.

This development is a very important one, and is almost precisely identical with the deposits known as the Harpending mine, near Lincoln, and that at Quail Hill, near Telegraph City and Copperopolis. Measures are in progress to secure still further developments with the view of eventually putting up machinery for working this newly found auriferous deposit. This locality is in Del Norte county, Low Divide District, about sixteen miles from Crescent City. There are several other copper mines in this district, which will probably be found to possess a similar deposit, as soon as attention is called thereto by this publication.

**ELECTION OF OFFICERS.—GOLDEN RULE M. Co.**—July 25th. Trustees: Wm. Bosworth, R. L. Pasteur, J. H. Turney, J. T. Boyd and E. V. Hathaway. President, Wm. Bosworth; Secretary, J. B. Russell; Treasurer, J. H. Turney; Superintendent, A. J. Pfeiffer. Office, southeast corner Sacramento and Montgomery streets.

**SUMMER G. & S. M. Co.**—August 5th. Trustees: John R. Mead, H. W. Byington, L. P. Peck, Jas. Adams and E. D. Wheeler. Office, Room No. 6, 729 Montgomery street.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**NEW HOISTING APPARATUS FOR MINES.**—An improvement has recently been brought out in England in the raising of cars, ores and debris from mines, which consists in the arrangement of a hucket or car elevator, in connection with guide wheels and rods operated by means of a hoisting rope or chain, working on a drum or windlass by horse or steam power, in the ordinary way for raising or lowering the hucket or car, so that it shall be steadily supported and discharged by the deflection of the guide wheels from their normal line of travel on to inclined ways, the axis of the guide wheels forming a traverse line of support, upon which the hucket or car is canted or tipped over for the discharge of its load, as it is raised by a lever hall attached to the lower end. By this arrangement no additional power is required to upset and empty the hucket or car containing ore or coal into the shoot at the mouth of the mine, as in ordinary methods of attachment, in which the hucket is suspended at a point between its upper and its lower end, and tipped over by some obstacle which arrests its motion—as, for instance, upsetting it by grasping and upholding the rim with the hands. An obstacle placed in the way of the hucket to tip it over increases the resistance at that point, suddenly producing a shock and strain on the power, which should be avoided, as the power in that case must necessarily be sufficient to overcome the greatest resistance in addition to that employed in the operation of hoisting. This arrangement permits the hucket or car to be loaded with coal or ore, or discharged at various points in the shaft of a mine, so as to be used for a number of drifts or levels at different depths, and also to discharge water into an adit or shoot for carrying it off.

**A NOVEL VESSEL.**—Mr. Wehb, the well-known New York shipbuilder, is now constructing for the inventors, Messrs. Blonquist & Crook, a queer kind of vessel-wagon which it is claimed will do as well on the land as in the water. It consists of a horizontal frame or raft resting upon the axles of three water-tight cylinders, drum-shaped, one forward and two aft; the latter being each half the size of the former, set parallel to each other, with a space between them of two and a half feet. Within this space is a parallel wheel attached to one of the drums, but of smaller diameter. Steam is to be used. The inventors say that in the addition to the advantage of being able to roll over a sand bar if one should "snag" in its progress, a much higher rate of steam can be obtained than with a vessel of ordinary construction, in consequence of the absence of friction, and the reduction of resistance.

**PROVIDENCE MINE.**—Mr. Dingley, discoverer and superintendent of this mine, located a mile below Nevada City, on Deer Creek, exhibited to us a heavy body of sulphuret ore some seven or eight feet wide, on a recent visit to the claims. Workmen were engaged near the surface on the ledge, stopping out ore for the mill, located at the foot of the hill, several hundred feet below. More than \$35,000 has been extracted from this chimney. A portion of the chimney averaged from \$15 to \$20 per ton.

The claims have been worked with more or less success for over eight years. The lower tunnel extends beyond the above mentioned chimney 300 feet, developing another chimney of paying ore. No work has been done below the level for want of hoisting machinery. There are 3,100 feet in the claims. The mill has a powerful engine, twelve stamps, five Knox and one William's pan, blanket sluices, and an Attwood amalgamator. Eight of the stamps weigh 600 pounds, two others 900 pounds. No. 2 screens are used in the battery. Four of Bradford's ore separators will be superadded by rockers for concentrating. Some rich sulphurets have been taken from the rock, which is usually hard to treat. A quantity of ore is accumulating, and the mill will soon be running. We believe the mine to be a valuable one, only needing a proper outlay of capital to render it very profitable. The company is incorporated in San Francisco, J. M. Buffington, Secretary. Mr. Dingley is a large shareholder and a diligent manager.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, AUGUST 10, 1857.

## Money Market.

We have no material change to note in the money market since our last issue. Capital continues abundant at easy rates—say 1½% per cent. in bank, and 1% per cent. per month as the outside rate in loan associations; less favorable names are negotiable at 1½% per cent. per month. The liberal dividends already announced for August, and others that will yet be made, will add considerably to the present available funds. The requirements for business purposes are far from pressing, and the demand is in the main regulated by immediate local wants.

The Treasury received from the interior, through the principal public channels, from the 1st to the 7th inst., inclusive, amounted to \$1,129,856, showing a very fair increase over the returns for a like period at the close of July. The receipts coastwise have been \$140,000 from Portland, Oregon, \$20,700 from Victoria, and \$8,300 from Crescent City.

Quotations for steamer purposes are as follows: Gold Bars—in rather good supply—rule at 890@900; Silver Bars, from ordinary grades at par to ½% cent. discount, and ¼% cent. premium. Currency Bills on the Atlantic cities are offered at 35% cent. premium; and Sight Drafts, payable in coin, can be had at 2½% cent. premium. Telegraphic transfers are made at 2½% cent. premium. Mexican dollars are quotable at 3¼@3½% cent. premium, nominal.

Sterling Exchange on London, bankers' 60 day bills, 48½d; Commercial do. 49@49½d. Exchange on Paris, 6 francs for 30 days' bills.

## City Stocks.

The stock market, other than mining shares, remains inactive, and the sales during the period under review have been very limited. At the close we note sales of San Francisco Gas Company at \$64 50@64; and Spring Valley Water at \$66 75 per share. North Beach and Mission R. R. is quotable at \$49 60@50 50. This company will in all probability pass its usual monthly dividend. They recently lost the suit pending in the Kearny street widening case amounting to \$20,000 in currency, and the additional track required in this street will involve an expenditure of about \$10,000, besides they are at present carrying an indebtedness of about \$10,000. We hear mention made of the extension of the Front Street, Mission and Ocean Railroad beyond its present terminus. How soon or to what point we have not learned. We quote it at \$15 bid \$20 asked.

## Mining Share Market.

The mining share market, since our last reference, has been exceedingly depressed, most shares falling much below our previous quotations. Want of confidence seemed to pervade all dealers, and during the past week the investments have been mostly made for speculative purposes, though even on this account the demands have not been very pressing. Fear had taken possession of timid holders, and the purchases made one day were sacrificed in many instances at an enormous discount the succeeding day. However, on the contrary, pretty extensive option purchases have been effected in several active stocks with a view of replacing, to some extent, at least, the heavy losses recently sustained under the rapid decline; and we think with some prospects of success. The demand at the close to obtain shares at a low figure, has stimulated the market considerably, and a few stocks have stiffened somewhat—Independent of all other considerations—under this influence. If the least sustaining power is given to this movement a rally may be anticipated throughout the entire list. A number of companies have already announced their usual monthly dividends, and so far as we have been able to ascertain, the bullion product of the companies usually embraced in our statements, which is a true index of the condition of the Comstock Lode, has been \$1,475,000 in July, against \$1,438,387 in the month of June.

**SAVAGE**—Opened at \$4,450 per foot, then sold at \$226 per share, under the subdivision of the stock, equal to \$4,500 per foot, received to \$195, ex-dividend, and closed at \$194. During the week ending August 3d, 2,144 tons of ore were extracted, showing an approximate value of \$78,157, or \$36 45 per ton. This ore is classified as follows: First, 13 tons; second, 255 tons; and third, 1,876 tons. The north mine, on the seventh level, continues to yield the largest quantity, having produced 1,170 tons during the week under review. The mine is reported to look as well as formerly. During the month of July the bullion returns, in round numbers, aggregated \$975,000, against \$970,500 in the month of June. A dividend of \$12 60 per share, equal to \$250 per foot, was payable on and after the 8th inst. At the close we learn that ore on the seventh or second station is in some places sixty feet wide. In the middle drift, on the third station, penetrated ore fourteen feet thick, which is said to be of a fair third rate quality.

**HALE & NORCROSS**—Continues out of the market; offered at \$3,000 per foot. A winze has been started on the 750 foot level, which, at a depth of eighteen feet, carries the same quality of ore as found above; otherwise, no change to note. Work on the new shaft has been suspended for a few days, owing to the strong flow of water. The 65 per cent. assay value of 3,278 tons of ore sent to custom mills during the month of July is \$133,906 17, equal to \$40 35 per ton, against a product of \$117,728 23 in the previous month from 3,302 tons of ore; however, in July the mills did not fully work up to the 65 per cent. extraction, which, in order to show the exact yield, will reduce the above figures a trifle. The usual monthly dividend will be disbursed on the 15th inst.

**CROWN POINT**—Was in less favor early in the week at a decline, gradually receding from \$1,035 to \$900, rallying to \$1,100, and closing at \$1,290. The bullion returns in July show a yield of about \$117,000, against \$77,550 in June. Since the 1st inst. the 65 per cent. assay value of,

400 tons of ore show a yield in bullion of \$14,681, the assays per ton running from \$46 22 the highest, to \$27 63 the lowest. A telegram of the 9th states "that they are down twelve feet on the 600-foot level; ore nine feet wide, and of fine quality."

**YELLOW JACKET**—Has fluctuated considerably, opening at \$1,060, advancing to \$1,110, dropping to \$985, then selling at \$1,075, and closing at \$1,065. It is said that a fair body of ore eighteen feet wide has been developed above the 700-foot level, 180 feet to the north, with good indications as to the probable extent.

**GOULD & CURRY**—Has been in less favor at a considerable recession, declining from \$665 to \$530, and closing on Thursday at \$540. The mill started on the 2d inst., and is said to work well. The supply of ore at the mine and mill amounts to about 6,000 tons, and during the past two weeks one hundred tons have been extracted daily from the old chambers. There is no very material change to note in the mining operations at a greater depth.

**CHOLLAR-POWELL**—Has been somewhat inquired for at declining rates, receding from \$415 to \$330, improving to \$366, and closing at \$364. The developments at the Blue Wing station, it is reported, show a large body of ore stated to be 75 feet high and 20 feet wide. No change in the drift on the 711-foot level. Difficulties are encountered in sinking the shaft by the appearance of clay, which is said to extend over the west half, and is pitching to the east at an angle of about 65 degrees. The bullion returns in July amounted to \$311,681 17, being the product of 11,221 tons of ore; in June the receipts aggregated \$345,000. They make a net profit of \$90,000. It is expected that the usual monthly dividend will be disbursed this month.

**KENTUCKY**—Participated in the general decline, opening at \$350@365, falling to \$305, then selling at \$285 ex-dividend, and closing at \$330. We have been unable to obtain any information in regard to the condition of the mine. The bullion yield in July amounted to \$125,767 31; in June to \$130,255 51. A dividend of \$40 per share is payable since the 8th inst.

**IMPERIAL**—Receded from \$203 to \$180, rallied to \$185, and closed yesterday at \$178. No change in the mine or mills. The construction of new works at the Imperial-Empire shaft is progressing rapidly, and it is expected that the engine will soon be in position. The stamped value of the bullion received in July amounted to \$95,627 64; in June \$107,000.

**OVERMAN**—Was one of the principal features of the week in stock circles, selling quite extensively at variable rates, opening at \$90, dropping to \$47 50, gradually improving to \$106, and closing at \$75. The latest information is to the effect that ore is making its appearance in the south drift from the fourth floor of the 300-foot level. The ore extracted to July 31st amounts to 2,970 tons, of which 591 tons were reduced at the Sacramento Mill, showing a yield of \$22,970 04, or \$37 83 per ton; 380 tons at the Winter's Mill, yielding \$11,971 11, or \$31 60 per ton, and 834 tons at the Excelsior Mill, producing \$29,430, or \$35 28 per ton. The aggregate yield has been \$63,771, and the milling expenses amounted to \$26,220. On the 8th inst. an additional bar, valued at \$2,000, was received.

**OPHIR**—Has been less active, receding from \$116 to \$95, and closing yesterday at \$100. Preparations to commence sinking the new shaft have not yet been fully completed. Work is continued on the lower level, and it is said with some hope of success.

**CONFERENCE**—Sold within a range of \$60@65. It is said that the ore in the third level, from which the greatest supply has heretofore been obtained, is nearly exhausted in the northern part, but the southern portion will continue to yield considerable yet. A drift from the second level, on the east ledge, in running south 60 feet from the shaft, is reported to look very well. During the month of July the bullion receipts amounted to \$16,627 62 against \$14,000 in June. The average yield per ton was \$19 05.

**GOLD HILL QUARTZ M. & M. Co.**—Sold at a marked decline, closing at \$131. It is said that fine ore is at present sight. The bullion returns in July aggregated \$10,250 57; in the previous month, \$12,500. The expenses are stated at \$6,830, leaving a balance of \$3,420. A dividend of \$15 per share will be disbursed on the 15th inst.

**ALPHA**—A few feet sold at \$400. BELCHER advanced from \$175 to \$235. SIERRA NEVADA advanced from \$25 to \$45, then sold at \$35, and closed at \$40. This improvement is based on the prospects of reaching the ledge after the water is pumped from the mine, machinery for this purpose being nearly ready.

**EMPIRE**—Sold uniformly at \$180. The receipts of bullion in July amounted to about \$25,000; in June, \$21,600. BELCHER advanced from \$4 50@8. Work has been suspended in this mine. They are waiting to take up the drift from the Overman mine, so soon as that company reaches their line, and mean to develop their property through that level at a greatly reduced expense. An assessment of \$1 per share was levied on this stock on the 6th inst.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,229,880.

**THE "SPOCK REPORT"** is a new circular, published daily, by Wheeler & Co., giving list of sales by the Stock Board and at the Long Room, with late items from leading mines.

## Our Patent Agency.

The PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

INDIA RUBBER PAINT.—Messrs. Epes & E. H. R. Ellery hold the right to manufacture and sell for the Pacific coast, "Elery's Patent India Rubber Cement and Paint," which is now being extensively introduced in the Eastern States. This paint is formed by dissolving elastic gums (such as india rubber, etc.) in linseed oil. It is ground in all colors, and used for outside surfaces generally, but is more especially adapted to covering roofs. It is largely used also for marine paint. It is adapted alike for brick, wood, cloth, metal, etc., and is perfectly impervious to water. Its elastic nature would seem to make it especially adapted to our California climate, where great alternation of shrinkage and expansion occurs between the dry and wet seasons. It is also especially serviceable for steamboats, railroad cars, etc., as it does not crack, peel or blister. This paint has already had an extensive and thorough trial on a large number of the most expensive and prominent buildings in New York, both public and private. It has also been placed upon a large number of buildings in this city, as will be seen by reference to their advertisement in another column.

STILES' MILL, NEVADA CITY.—Several of Cralls' waltzing pans are running with success in this custom mill. In some of them, Mr. Stiles has introduced wooden mullers alternated with iron. They grind well, wear well, and amalgamate better, according to Mr. Stiles' views. He has also introduced part wooden shoes in his Knox pans, with similar results. His works show constant experiments. Close observation seems to have established his faith in the value of a wood grinding surface for amalgamating closely. In this mill we also noticed a set of improved wooden guide boxes for stamps. Each box consists of four pieces, forming a block some eight inches in length, with four square outsides, an inch or two greater in diameter at one end than at the other. The inner edge of each piece is grooved to form one-fourth of a circle for the opening for the stamp stem. A collar, with bolts, fastens the guides to the plate. The advantage consists in the ready manner in which the boxes, when worn, are readjusted to fit the stem. This is accomplished by simply planing down the sides of the four pieces, thus contracting the opening. Mr. Stiles has several inventions likely to be heard from hereafter.

Mining and Scientific Press PATENT AGENCY.

DEWEY & CO., SOLICITORS OF

American and Foreign Patents, 505 Clay Street, corner Sansome, SAN FRANCISCO.

Patent Cases of every kind conducted. Attention given to Re-issues, Extensions, Interferences, Rejections, Appeals, etc., etc.

ASSIGNMENTS, POWERS OF ATTORNEY, AND LETTERS OF ADVICE CAREFULLY PREPARED.

ENGRAVINGS FINELY EXECUTED.

COPIES OF PATENT PAPERS,

Issued by the United States or Foreign Countries, procured in the shortest time possible.

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Table with columns: NAME, LOCATION, AMOUNT, AND DATE OF ASSESSMENT, DAY OF DELINQUENCY, DAY OF MEETING. Lists various mining companies and their financial details.

\*Those marked with an asterisk (\*) are advertised in this journal.

Latest Stock Prices Bid and Asked.

S. F. STOCK AND EXCHANGE BOARD.

Table of stock prices for various companies and bonds, including United States 7 1/2% Bonds, San Francisco City Bonds, and various mining stocks.

INSURANCE COMPANIES.

Table listing insurance companies and their capital amounts, such as Fireman's Fund Insurance Co., Pacific Insurance Co., etc.

MINING STOCKS—WASHOE DISTRICT.

Table listing mining stocks in the Washoe District, including Alpha, Baltimore American, Belcher, etc.

San Francisco Market Rates.

Wholesale Prices.

Table of wholesale prices for various commodities like Flour, Sugar, Coffee, etc., as of Friday, August 9, 1867.

GROCERIES, ETC.

Table of grocery prices for items like Sugar, Coffee, Tea, etc., as of Friday, August 9, 1867.

Table of retail prices for various goods like Butter, Cheese, Eggs, etc.

Retail Prices.

Table of retail prices for various goods like Butter, Cheese, Eggs, etc., with prices per pound or dozen.

San Francisco Metal Market.

PRICES FOR INVOICES.

Jobbing prices rule from ten to fifteen per cent. higher than the following quotations.

Table of metal market prices for various items like Iron, Steel, Copper, etc., as of Friday, August 9, 1867.

ESTABLISHED [MAY, 1860.]

VOLUME FIFTEEN

Mining and Scientific Press, COMMENCING JULY, 1867.

DEWEY & CO., Publishers.

Issued every SATURDAY, at our Book and Job Printing Office, 505 Clay street, corner of Sansome, SAN FRANCISCO. Terms in Advance—One year, \$5; six months, \$3; single copies, 15 cents; Monthly Series, \$5.00 per year, or 65 cents per number, per volume from January, 1864, \$3 per volume; bound, \$5 per volume.

The Mining and Scientific Press is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal on this coast. The individual character and reputation of its constant patrons throughout the entire coast is one of the best recommendations of its merits and value as a medium of intelligent progress and prosperity.

DEWEY & CO., Proprietors, Mining and Scientific Press Patent Agency, Newspaper, Book and Job Printing Office, 505 Clay street, San Francisco.

MINING AND SCIENTIFIC PRESS.

Terms of Advertising and Subscription.

Miscellaneous Advertisements.

One week, per square, \$1 50; One month, per square, \$3 00; One quarter (3 months), per square, \$7 50.

Advertisements of great length, or of special character, inserted by contract on the most favorable terms.

The space of ten lines of solid type advertising type constitutes a square.

Mining Advertisements.

Notices of Meetings, per square, three weeks, \$3 50; Notices of Meetings, per square, four weeks, \$4 00; Assessment Notices, of ordinary length, four weeks, \$3 00.

Assessment Notices, of more than usual length, four weeks, for each additional square, 4 00; Delinquent Sales, per square, two weeks, 2 50; Delinquent Sales, per square, three weeks, 3 50; Postponements, per square, one week, 1 50; Lists of Advertisements printed, for meetings or assessments, per hundred, 1 00; Advertising law blanks, circulars, and cards, Free.

Terms of Subscription.

One copy, one year, by mail, in advance, \$5 00; One copy, six months, by mail, in advance, \$3 00; One copy, one year, by express, 5 50; One copy, six months, by express, 3 50; Five copies, one year, by mail, in advance, 20 00; By city carriers, per month, 50; Single copies, 15; Monthly Series (or parts) one year, by mail, 5 50; Monthly Series, per monthly copy, 65.

The Circulation of the Press, already extensive, is rapidly increasing, and substantial tradesmen who can profit by widely disseminating information of their business amongst the most intelligent, influential and industrial classes of the Pacific States and Territories will find no more effective or economical medium for advertising.

DEWEY & CO., Proprietors, Patent Agency and Job Printing Office, 505 Clay street, San Francisco. (Main.) July 1, 1866.

Blanks, Blank Mining Books, Constitution and By-Laws

Mining and Prospecting Companies

Elegantly printed, with care and dispatch, at the office of the Mining and Scientific Press.

Orders from the interior faithfully attended to.

WOODWARD'S GARDENS, with its rare assortment of birds and animals, its cabinet of minerals, gallery and museum, will afford pleasure and profit to all. Miners and others from the interior should not fail to see the wonders displayed here in such beauty and variety.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

Table listing various books for sale, including 'ANSTED'S Gold Seekers Manual', 'ANTISELL—The Manufacture of Photogenic or Hydro-Carbon Oils', 'BLAKE, W. P.—Geological Reconnaissance in California', etc.

Any of the above Books will be furnished by return mail or express, on receipt of the price with postage added. Any other books desired will also be furnished at the lowest San Francisco retail prices. Address, DEWEY & Co., Mining and Scientific Press Office, San Francisco, 1413-13mtfr

National Mineral Land Law, Instructions, Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the United States Registers and Receivers and Surveyors General, from the Commissioner of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address DEWEY & Co., office Mining and Scientific Press, San Francisco.

STOCK CERTIFICATES, STOCK TRANSFER JOURNALS, STOCK LEDGERS, ASSESSMENT RECEIPTS,

And all other Blanks, Blank Books, etc., required by Mining and other Corporations, kept on hand or printed to order on short notice, at moderate prices, at the office of the Mining and Scientific Press.

## Notices to Correspondents.

INVESTIGATOR wishes to know the probable origin of diamonds. In replying to this query, we can scarcely do better than detail the theory of the late Prof. George Wilson, who suggested that the diamond may possibly originate from anthracite, without the solid condition of the latter being changed. As hydrogen, oxygen, nitrogen and sulphur, together with part of the carbon, may be gradually eliminated from anthracite in the form of volatile compounds, the residuum might assume the crystalline state by a change in the allotropic condition of its atoms. A low temperature, combined with the slow development of the process, might produce the diamond; whilst a high temperature and rapid development would give rise to graphite. Wilson, however, by no means inferred that the diamond might not be formed in other ways—either dry or moist. We think it was in the course of perusing some of Sir D. Brewster's writings that we observed it mentioned that once in the examination of some vegetable carbonaceous matter it was unexpectedly found in the interior of one of the nodular pieces that there existed a few drops of colorless, transparent and highly refractive fluids; but, owing to its evanescent quality, it was impossible to collect it for analytical examination. Such a phenomenon is quite possible by the recognized principles of chemistry, and is, we believe, the only instance recorded of a possible approach, in the natural way, to the production of the diamond by the moist mode.

**J. L. B., Placerville.**—You cannot obtain more power from a 24-foot than you can from an 8-foot wheel—the head and fall being the same in each case. The points to be considered in determining the proper diameter of such a wheel are, the required velocity of your wheel to suit the machinery and the height of fall. If a high velocity is required, and you have but a low fall, a wheel of small diameter is best; and if, on the contrary, a low speed is required, and you have a high fall, a wheel of large diameter is preferable. In your case, supposing the most suitable speed of the wheel for driving your machinery to be sixty revolutions per minute and the fall one hundred and fifteen feet, the diameter should be about thirteen feet; and if only forty-five revolutions, seventeen feet. The quantity of water to give fifteen-horse power with a fall of about one hundred and fifteen feet, is about fifty-five inches, miner's measure.

**MACHINE TOOLS FOR JAPAN.**—Messrs. Kittredge & Leavitt, iron workers on Market street, have received an order from Japan, through Macondray & Co., for a set of boiler punches and shears. The Japanese will no doubt soon become large customers for tools and machinery from this city.

CONTINENTAL Life Insurance Company  
302 Montgomery street, corner of Pine.

## Mining Machinery—Information Wanted.

J. Ross Browne, in his first report upon mining west of the Rocky Mountains, has described the action of the various batteries and pans, used for crushing, grinding and amalgamating; but he furnishes no data from which the miners can form any opinion as to the comparative merits of the various machines in use. Mr. Brown could hardly do a better thing, or render a greater service to the miners, than by suggesting in his next report, some means, or collecting some data by which they could form an intelligent idea as to what, out of the great multitude of machinery that is offered to the public, would be the best, most economical and most effective, under all or any particular circumstances. As it is, the miner has nothing but the reports of interested parties, or his own usually limited experience, to guide him in his choice. This condition of things, as might reasonably be expected, often results in great pecuniary loss. Among all the numerous quartz mills in operation in this State for extracting gold, there are probably no two which are operating precisely alike.

We have an almost infinite variety of batteries, pans, amalgamators, concentrating machines, riffles, plates, aprons, screens, etc., etc., from which to choose. A person about to build a mill, after looking around a little (and generally to very little purpose) guesses at some plan he has seen, and then proceeds to construct his mill. If he don't change his mind three or four times, at the suggestion of friends, before he has his mill completed, it is because he is possessed of more firmness and decision than falls to the lot of a large portion of our most intelligent miners and millmen.

Such results are inevitable from our loose and uncertain manner of working. If private individuals cannot be induced to undertake it, Government might do well to establish an experimental mill, where every new machine, as it comes out, might be tried, at the inventor's expense (government finding the necessary power, etc.) and under the direction of competent and intelligent men, before the public should think of placing the least confidence in the invention. The increase to the government in internal revenue receipts in this State alone, would pay for such an establishment every year; while the annual saving to the public in the cost of worthless machinery, time, etc., could scarcely be estimated.

We throw out these hints to the collector of mining statistics, and would furthermore suggest that he could in no way more effectually subserve the purpose of his appointment than by maturing some plan whereby the benefits hinted at may be practically attained, and presenting it for the consideration of the government. Coming from him, would secure such suggestions a hearing and consideration which they can scarcely attain if presented from any other source. We are aware that the report must soon be on its way to Washington; but it is not yet too late to consider and incorporate this matter therein, if, indeed, it has not already been done.

Among the many things which the miners wish to know, and which few companies can afford to ascertain at their individual cost, is the relative efficiency of stamps of given weight—round or square; height and frequency of drop; general mode of arrangement of a battery, etc.; whether one pan is better than another, and which; whether the yield obtained is better in one than in another; whether one loses more or less quicksilver (and consequently gold) than another; the relative power required to drive the machines, in proportion to the amount of work done; the proportional wear and tear of iron portion of rock crushed; the amount of concentration effected by one concentrator over another; the manner in which it is done as to the compara-

tive loss of sulphurets, relative to cost of running, and amount of sulphurets saved to the mass put through, etc., etc. These are some among the many points which can only be decided in an experimental mill, and which should be conducted under governmental patronage by disinterested parties, whose reports should be officially promulgated for the benefit of the public. The expense of such an establishment, in some central locality, would be but trifling in comparison to the benefits which would accrue therefrom.

## The State Fair.

The next Fair of the State Agricultural Society will be held in Sacramento, commencing on Monday, the 9th, and continuing until Saturday, the 14th of September. As has already been stated, the Mechanics' Institute of this city has united with the State Agricultural Society, for the purpose of bringing about, on that occasion, a more full exhibition of the mechanical interests of the State than is usually witnessed at the annual exhibitions at the State Capital. We have already spoken at some length of the importance of such a step, and again refer to it, at this time, to note the progress which is being made to accomplish the desired result.

H. Rosecranz, H. J. Booth, W. T. Garrett, A. S. Hallidie and C. H. Harrison have been appointed by the Institute of this city a committee to act conjointly with a similar committee from the State Society in securing the necessary preparations and making awards in the mechanical and manufacturing departments of the Exhibition. A space of 160 feet in the Pavilion is being especially fitted up for the display of machinery and working models, and a 60-horse power engine will be set up to furnish the necessary motive power.

The committee in this city has entered heartily into the work, and has addressed a circular to manufacturers, inventors and mechanics, urging them to come forward and take a hearty and active support in the matter. Some one or more members of the committee will visit, in person, all the principal manufacturing works in this city and vicinity, to confer with their managers and proprietors, and to urge the importance of their cooperation. We are pleased to learn that the committee has thus far met with the most gratifying success in their efforts, and that there is every reason to believe that the mechanical part of the Exhibition will be fully equal to the agricultural, and that the whole will far exceed anything of the kind ever before witnessed at the Capital. Any further desired information may be obtained through the committee's secretary, H. D. Dunn.

The California Steam Navigation Company, with their usual liberality, have generously offered to transport all articles and animals exhibited at the Fair free of charge, freight paid on them to the Fair to be returned upon re-shipment by the same owner, on certificate of Secretary that the same have been exhibited. The company will also carry all members of the Society, on their return for home, during the Fair and for two days thereafter, free of charge.

**NEW INCORPORATIONS.**—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

**HIDDEN TREASURE CO.**—San Francisco. July 30th. Capital stock, \$20,000; 4,000 shares, \$5 each. Trustees: John Chapman, W. R. Gore and A. M. Chapman.

**HOUSE CARPENTERS' EIGHT-HOUR PROTECTIVE UNION.**—San Francisco. Aug. 3d. Capital stock, \$1,000,000; 10,000 shares, \$100 each. Trustees: F. Barker, James W. Duncan, Thomas H. Lufkin, James Vanriper, J. D. Connell, M. G. Shove, John D. Crowley, F. D. Morrill, J. J. Knowlton, E. Merrill and A. M. Winn.

**WHEAT.**—Immense quantities of wheat are being shipped daily from Knight's Landing, Colusa county, to this city.

## Varney &amp; Rix's Quartz Crusher.

In all of our quartz mills, whether working for gold or silver, a large amount of labor is expended in breaking up the rock, as it comes from the mine, into sizes sufficiently small to be readily placed under the stamps for further reduction. In most mills this work is done by hand, with a light, long-handled hammer. Latterly, however, some of our largest mills have substituted for this hand-work, machines called rock breakers or crushers, whose crushing faces consist of two huge iron jaws, one of which is stationary, while the other is made to vibrate back and forward with an oscillatory motion. These jaws are set so as to present a V-shaped opening for the reception of the rock which, by the vibratory action of one or both of the jaws, is gradually reduced from the time it is thrown in, until it passes out, reduced to the proper fineness, which is regulated by the opening at the lower portion of the jaws, thus V.

Quite a number of these machines have been from time to time introduced to the public, several of which have been illustrated and fully described in these columns. We were called upon on Monday last, to witness at the Miners' Foundry, the operation of still another machine of this description, recently invented and patented by Messrs. Rix & Varney, of this city. This machine differs materially from all of its predecessors, in the mode of producing the vibratory motion of the jaw, and in the great saving of weight of iron which is effected by its peculiarity of construction. The latter is a very important consideration, both in the cost of the machine, and in the greatly reduced expense of transportation thereby attained. We have not been able to learn either the cost or weight, as only one machine has yet been built, and the mechanics have not yet determined its cost.

The jaws are merely suspended in the wooden frame; a stout straight piece of wrought iron, acting as a lever, is so adjusted as to bear against the back of the lower portion of the fixed jaws, while an iron yoke, also of wrought iron, placed along on either side of the lever, passes entirely around both jaws, and clasps in its embrace, the lower portion of the other, or movable jaw. The jaws are hung upon one end of the frame, while the lever and yoke extends back some four feet to the other end thereof, and both are connected with a crank shaft across the top of the frame, the revolution of which gives the lever and yoke an up and down vibratory motion, and imparts a corresponding back and forward vibratory motion to the movable jaw which is clasped in the "bite" of the yoke.

A careful consideration of this adjustment will reveal a most ingenious and happy development of the device by which the crushing strain is taken off from the frame and placed within the wrought iron yoke, and a leverage obtained at the same time which can scarcely be exceeded. The movement of the jaw is very slight, less than that usually given; but such careful attention has been given to the construction of the face of the jaws, for avoiding the "slip" from the pinch, by which a large amount of power is usually lost, in similar machines, that even the slight motion given is found quite sufficient for the most effective work. This simple arrangement allows of a reduction in the weight of the machine of about one-half, and places the crushing pressure where but a slight motion exists, and where, consequently, but little friction occurs; while the hearings that have much motion have correspondingly light work, and but little friction. The practical mechanic and millman will readily see and appreciate this as a strictly correct and economical application of mechanical laws.

The machine can be readily adjusted to crush coarse or fine, as desired, while the jaws can as readily be made to have a long or short throw, to accommodate hard or soft rock. The shoes on the faces of the jaws are made so that they can be turned end for end, as the wear upon the material requires.

The economy of machinery of this description for the preparation of rock for the stamps, is now pretty generally conceded; and there can be but little doubt that the time will soon come when no mill will be considered complete until it has a rock breaker in front of its battery. A patent was issued to Messrs. Rix & Varney for their invention, on the 15th of June last, and we presume they will forthwith commence manufacturing them to order. They will be built at the Miners' Foundry on First street.

The Central Pacific Railroad.

NUMBER TWO.

PREPARATIONS FOR WINTER.

Our recent journey over the route has dispelled all lingering doubts of the ability of the company to keep the road open during the winter, with less average delays than occur on the railroads of New England and Western Atlantic States. Most of the route through the snow-belt is along the mountain side, where the snow can be thrown by the plow down the embankment. Another portion comprises omhankments and trestle-work, where the snow can be thrown down upon either side; while the balance is principally through tunnels and cuts. The latter gave the principal trouble last year. Through these cuts the company are now constructing coverings with sides, appearing like covered bridges. The timbers are strong and well braced. The openings are some fourteen feet wide by about 20 in height. A space is left between the timbers and the sides of the cuts, which will naturally fill with snow; and when the shed is imbedded in snow, packed in at the sides, we do not see why it will not form a solid fixture, not to be carried away by snow-slides short of taking the side wall with it. The grade itself adds, to the down trains, nearly double force to the power of the snow-plow.

An experience of five years in the high altitudes of the Sierra convinces us that the mild temperature of our winter weather is strongly favorable to the keeping open of this road in contrast with the intense, piercing cold that prevails upon northern Atlantic railroads for weeks at a time. Consequently, in case short sections of the route should become blocked up, the work of clearing out will be attended with less difficulties.

THE GRADE.

The altitude of the summit is 7,042 feet above the level of the sea. The steepest grade is 116 feet to the mile. For nine miles above Dutch Flat the ascent is at the above rate.

THE TUNNELS.

In hight, the tunnels are nineteen feet to the crown of the arch, and sixteen feet wide in the clear. One which we noticed near Cisco is on an eight-degree curve through the hardest kind of trap rock—a formation three to four miles in extent, lying between two immense ranges of pure granite.

The summit of the grade is about fifteen miles beyond Cisco, or 112 miles east of Sacramento. Near the lower end of Donner Lake, four hundred feet beyond the highest grade, sloping toward the Atlantic, is the summit tunnel, 1,700 feet in length. Four hundred feet further east is another tunnel of over 100 feet, and beyond that, about 1,000 feet, a third tunnel of 375 feet. These tunnels are upon an air line and even grade of one-tenth of a foot to nine feet, and, when completed, the eye can penetrate through them all at one glance. The tunnels are all designated by numbers, summit tunnel being enumerated the sixth. There are numerous other tunnels east of it.

TUNNEL WORK.

The summit tunnel is worked from the east and west ends and from a shaft in the center towards the east and towards the west, making four headings. The rock is granite. No timbering is necessary. The west end has worked considerably the easiest, although hothered with water. Workmen broke through the facings and met in this half several days since. Daylight is expected to meet in the eastern half within one week. The shaft through which the headings are worked from the center is double, and ninety-one feet deep, worked by an engine.

Four or five drills and fifteen men to a shift are employed in each heading. Shifts eight hours each. The headings are worked only a few feet in hight, forming the top of

the tunnel. The bottom is taken out more leisurely by large gangs of workmen.

From ten to fifteen feet per week is the average advance made in each heading, although near twenty feet has been attained. This rate, even, is only attainable by the aid of

NITRO-GLYCERINE.

By its use one-third in time and expense is saved. This blasting oil is made by the company and mixed near the work. In the headings, six blasts are made in twenty-four hours, making two sets of holes two feet or more in depth and 1 1/4-inch in diameter; cartridges, six inches long, one inch in diameter, containing five inches of oil. Some four to five-inch cartridges are used. The one and a quarter-inch hole with five inches of nitro-glycerine is declared better than a two-inch hole with twelve inches of gunpowder.

Under proper instructions, Chinamen are reported by the overseers to be quite apt in holding and striking the drill, although not equal in capacity, man for man, with white laborers. Certain it is that they have been a powerful auxiliary in speeding on this great work, which to-day is nothing less than a national necessity.

PUSHING AHEAD.

Above Cisco, in large gangs and small squads, workmen extend along the line, finishing up the cuts and tunnels ready for track-laying, twenty-five miles or more of which the company are determined to have in running order this fall, that the terminus for the winter may be at least twelve or fifteen miles beyond the summit. No one who examines the present operations will doubt the determination of the managers to push on the work with all possible speed.

THE PRESENT TERMINUS.

Cisco is divided into two villages—upper and lower. The latter has a level site along one of the forks of the Yuha river, whose waters here are clear as crystal. Contains about fifteen or twenty business houses, and was built up during the Meadow Lake excitement, two years ago. Donner and Meadow Lake wagon roads pass its center, which is half a mile below and north of the other Cisco.

Upper Cisco is close to the railroad grade, nearly the size of the lower village, and built principally within the past few months. The station has a warehouse and freight shed some 700 feet long. It is a leading feature of the place, and yet insufficient to accommodate two-thirds of the freight. Both towns are literally thronged with large freight wagons and mule teams, repairing and loading for or returning from Nevada State.

LOCOMOTIVES.

Twenty-four locomotives are now on the road and in the repair shop, some of which are of large size and power, for freighting. One has been lately transported over the summit, to assist in finishing the advance section. The present repair shops at Sacramento are only temporary, and yet they employ about seventy-five men. The foundation for permanent engine houses and repair shops is now being prepared, and it is not improbable that before many years the company will not only do all its repairing, but advance into locomotive building.

NORTH AMERICA

Life Insurance Company.

Usual Restrictions on Occupation and Travel ABOLISHED!

Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.

The most Responsible and Liberal Company in the World!

Managers Pacific Branch, 302 Montgomery St.  
20v14nr9p SAN FRANCISCO.

MARKET STREET HOMESTEAD ASSOCIATION.—J. S. LUTT, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 7v15

SECRETARIATSHIP FOR MINING COMPANIES.—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v15tr

Gold Bars, of whatever size, if well cast, assayed for two dollars, at A. P. MOLLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint. 16v143m

JACOB SIEGW, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street,) takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 10v140f

Brown's Filtering Heater.—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to AUSTIN A. WELLS, Agent. 6v14ty

Perry Davis' Vegetable Pain Killer.  
A CERTAIN ANTIDOTE FOR PAIN.—Rev. T. Allen, writing from Tavoy, Burma, says: "Within the past four years I have used and disposed of about five hundred bottles, but am now out. Please send me a fresh supply as soon as you can—say two hundred bottles. I dare not be without it myself, and there are endless calls for it, both by Burmahs and Karens. I always take it with me in the jungles and have frequent occasion to use it, both on myself and others. One night, while sleeping in an open Zayat, I was awoken by a most excruciating pain in my foot. On examination, I found I had been bitten by a centipede. I immediately applied the Pain Killer, and found instant relief. In less than an hour I was again asleep."  
Rev. Mr. Hubbard, writing from Burma to his father, says: "I have used Davis' Pain Killer for Coughs, Colds, Summer Complaints, Burns, and for the sting of scorpions, with uniform success. We always keep it where we can lay our hands on it in the field, and need it."  
Sold by all Medicine Dealers everywhere. 5v15-lm

FACTS FOR THE PEOPLE.—Every family should have a bottle of Healy's Curative Oil in the house, prepared to annihilate pain. It is the best remedy in the world for Rheumatism and Gout, Neuralgia or Headache, Toothache, Cramps in the Limbs, Diarrhoea, Sprains, Bruises and Burns and Cuts; Scalds, bite of poisonous insects, Frozen Feet, etc. Be your own physician, and get the best, for the best is the cheapest. The Curative is composed of eleven ingredients, active and penetrating in their nature, and of purely vegetable extraction; is free from all minerals and acids deleterious to the human system; is warranted to give immediate relief from pain, and the cure is permanent. Sold by all druggists. Principal Depot, No. 6 Montgomery street. 22v14-lamf

MOSHEIMER'S PIONEER MINING SCHOOL AND Metallurgical Works.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:  
1. Assaying of ores, metals and other mineral substances.  
2. Technology, or Chemistry, as applied to any special branch of manufacturing.  
3. Metallurgy of gold, silver, lead, copper, etc., by smelting, amalgamation, and other processes.  
4. Gold extraction by chlorine gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.  
5. Concentration, Dressing of ores.  
6. Construction of furnaces, in which any kind of fuel may be used for smelting, roasting, etc., as well as the erection of any machinery or apparatus required in metallurgy and technology.  
Mining is considered by many a very hazardous undertaking; but I can assure anyone that our mines are as safe an investment as any other business when properly understood and managed; therefore, learn first, if you have a mine, then study the nature of the ore, and how to work it, and you will never fail to be successful.  
It may not be superfluous to state that I am theoretically and practically acquainted with all the branches I offer to teach. Years of actual experience in the laboratory, smelting works, quartz mills, and other manufactories carried on on my own account, have not only given me lessons, but more than ordinary ability.  
I was the first one in California who successfully extracted silver by smelting, on a large scale, and have since been traveling through the manufacturing and mining towns of Europe, to study all improvements, and am now again the only one in San Francisco who undertakes to work any kind of ores by either roasting, smelting, lixiviation, or chlorination process.  
I also undertake the erection of smelting and roasting furnaces, and furnish plans and estimates for any kind of works.  
My lately invented Roasting Furnace has the following advantages: A Furnace of the capacity to roast one to one and a half tons of ore per day can be built for \$340. It requires half a cord of wood per ton of sulphurets. The total expenses of roasting are not over \$6. The roasting is more perfect, as the ore appears in a spongy condition and eagerly takes up the chlorine gas or quicksilver when amalgamated. A large size furnace in successful operation may be seen, by permission of Mr. Maltman, in his works in Nevada City. Several others are in progress of building.  
Charges for assaying gold or silver ores..... \$3 00  
Copper ores..... 5 00

AGENTS WANTED

ENERGETIC MEN OR WOMEN CAN MAKE MONEY in canvassing for our NEW BOOKS and ENGRAVINGS. One Agent reports thirty three orders for one Book in three days. Address, PACIFIC PUBLISHING COMPANY, 4v15qr9p 305 Montgomery street, San Francisco, Cal.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Iron Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.** Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler and Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veitch's tubs, Frater's concentrators, Wakley's pans, Beers' pan, German Barrels, Astra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron screws, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GED. W. PRUSSOTT. IRVING M. SCOTT.

**POWERFUL FOUNTAIN.**—The most powerful fountain in the world is at Bennington, Vt., on the premises of S. B. Hunt. The water is brought in a six-inch pipe from an elevation of 325 feet, and is thrown in an inch jet to the height of 154 feet. The base of the fountain is 100 feet in diameter and 4 1/2 feet deep, and the entire work cost \$20,000. The celebrated fountain at Chatsworth, England, throws a jet only 90 feet high.

We find the above going the round of our exchanges, and copy to note its inaccuracy. The Chatsworth fountain alluded to is two inches in diameter, and throws a jet 200 feet high. (See Downing.)

THE Easton (Penn.) *Argus* chronicles the passage over the Lehigh Valley Railroad of probably the largest train of cars ever run over any road. The train consisted of 275 cars, and allowing six tons as an average to a car, we have a total of 1,650 tons, and fourteen feet to a car and coupling, the length in feet would be 3,850—over two-thirds of a mile.

A TAX-RIDDEN CITY.—New York city has a burdensome tax bill of \$21,889,655.98 for 1867, against \$15,960,767.88 last year. This increase is mainly due to political mismanagement.

It is said that one hundred Californians were recently stopping at the Grand Hotel in Paris.

**Machinists and Foundries.**

**PALMER, KNOX & CO.,**  
Golden State Iron Works,  
Nos. 19, 21, 23 and 25 First Street,

**Superior Workmanship**  
of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.  
Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular.  
25v12-3m

**IRON TRADE.**—The magnitude of the iron trade of which Cleveland, Ohio, is the center, may be seen from the fact that in one week 3,180,000 pounds were received at, and 1,470,000 pounds were shipped from that city.

The secrets of health are six: First, keep warm. Second, eat regularly. Third, maintain regular bodily habits. Fourth, take early and very light suppers. Fifth, keep a clean skin. Sixth, get plenty of sleep at night.—*Dr. Hall.*

We find it stated that the bones of the soldiers, horses and cattle killed at Bull Run are being gathered by the owners of the soil and shipped to Baltimore, where they are ground for fertilizers.

**American and Foreign Patents.**—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

**THE PACIFIC IRON WORKS,**

**First & Fremont Sts., between Mission & Howard, San Francisco.**

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Creese Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

**Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully Solicited.**

MECHANICS' INSTITUTE. Resources of California. THE MECHANICS' INSTITUTE of San Francisco, hereby offer a PREMIUM OF ONE THOUSAND (\$1,000) DOLLARS for the best Essay on the "RESOURCES OF CALIFORNIA, AND BEST METHOD OF DEVELOPING THE SAME," under the following conditions: One-half of the premium in cash on the certified award of the Committee of Judges, and the balance from the first proceeds of sales of the successful work, which is to belong to, and will be published by, the Institute. The Essays are to be handed in to the Librarian of the Institute on or before the FIRST DAY OF JUNE, 1883, and the award will be made by the Judges at the opening of the Industrial Exhibition, which is to be held in August or September following. The Essay should be divided into three great heads, viz.: Mineral, Agricultural and Industrial Resources, with proper subdivisions of each subject. It should be sufficient in quantity to form a duodecimo (12mo) volume of from 250 to 300 pages long primer type, solid. Writers will sign their articles in cypher, and send their names and address in sealed envelopes, which will be kept in a secure place by the Institute, and only be opened when the award is made. The manuscripts of unsuccessful writers will be returned to them without publicity. The Committee of Judges have the right to reject all Essays in case they do not consider them worthy of publication or the premium. No further instructions than are contained in this advertisement will be given to this Committee, nor will they be subjected to any advice from the officers or members of the Institute in regard to their proposed action. All manuscript submitted must be in clear legible writing, so as to admit of easy reading. The following named gentlemen, who have been selected for their well known ability, public spirit and integrity of purpose, will compose the Committee of Judges: Hon. Fred'k F. Low, S. A., Prof. J. D. Whitney, James Otis, Wm. Governour Morris, Maj. Gen. H. W. Halleck, U. S. A., Prof. W. B. Ewer, B. N. Bugbey. By order of the Board of Directors. D. E. HAYES, Secretary. San Francisco, June 12, 1887. 2v14-2m

EUROPEAN METALLURGICAL WORKS, Practical Mining School, Bryant Street, Between Third and Fourth, SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyritous, and the (so-called) "rebellious ores," are having special attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL. The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business. S. P. KIMBALL, J. R. MURPHY, 10v10

J. A. BAUER, Chemical Laboratory, AND DRUG STORE, 644 Washington Street. [Established 1849.] SAN FRANCISCO.

Careful Analyses made of Ores, Minerals, Waters, Oils, Liquors, Wines, Products of Art, etc. Pharmaceutical Preparations Made to Order. Opinions given on Chemical Questions and Geology. Particular attention paid to Analyses of all kinds, in cases where legal questions are involved. Pure Nitric Acid, Nitrate of Silver, Gold Chloride, Platin Chloride, Sodium Amalgam, Sulphate of Copper, etc., for sale. 12v14-6m

LACOUR'S SARSAPARIPHERE BITTERS

Have so speedily grown in favor that their unrivalled sale has attracted remarks and criticisms of the trade. Jealousy attributes their success to the meanness of their general style, and principally to the originality and beauty of the bottle, which was conceived and manufactured by California artists. MR. LACOUR, an energetic promoter of California resources, desired to show that California has no need of being tributary to other countries for talc or mechanical industry. The cause of their success is the great benefit they have been to the large number who have already used them. MR. LACOUR is a graduate of the Polytechnic Institute of France, and adds to a thorough knowledge of Chemistry many years of experience; and, after a long and careful experimental study, has been enabled to offer

LACOUR'S SARSAPARIPHERE BITTERS. They are the most efficient Blood Purifier, because they combine with the wholesome Sarsaparilla, which operates by cutaneous excretions, and other substances which gently stimulate the secretions of the lower glands and organs, render digestion easy, obviate costiveness, and remove regularly every impurity of the blood. They are unrivaled as a remedy for Scrofula, Dyspepsia, Constipation, Liver Complaint, Nervous Affections, Colic, Intermittent Fevers, and all diseases arising from impurity of the Blood or Costiveness.

Who Takes Them? The Old Man Takes them as a gentle stimulant and mild rejuvenator. The Young Man Takes them to regulate his system, prevent disease, and stimulate to new life his overtasked body. The Young Woman Takes them to secure regularity in her habits; to tint her cheeks with the bloom of health; to give a sparkle to her eyes, and sweetness to her breath. The Husband Takes them to promote vitality, give strength to the body, peace to the mind, and with his health, wealth and comfort to all his family. The Wife Takes them to invigorate and strengthen her system, and as an aid to nature in regulating her periodical sickness. Children Take them as a gentle, yet effective tonic. The Dashaway Takes them as a mild, pure stimulant, containing none of the deleterious, essential and tussil oils of forbidden drinks. The Inebriate Takes them to give tone to his poisoned stomach and allay the fearful longings for strong drink with a stimulant that does not madden or destroy. The Traveler Takes them to prevent sea sickness, and secure his health against change of climate.

Everybody Takes Them! PRO BONO PUBLICO: 2v15-6m

To Those Whose Interests We Represent.

While there is every reason for gratification at the circulation which this journal has already reached, we are yet well aware that there are great numbers of miners, mechanics and lovers of science to whom it might be made a source of much usefulness and profit.

New subscriptions will be received at all times by mail or otherwise. Those who have friends that they think might be interested or benefited by the paper, will confer a favor both upon them and us by calling their attention to this matter, and at this time.

We trust that it is needless to urge upon our readers the necessity of promptly renewing their subscriptions. The two indexes for volumes XII and XIII, which we have already published, and the 500 ample pages of reading matter, apart from advertisements, to say nothing of our numerous engravings and illustrations, speak more for the value which we give for the price of a year's subscription than we can say in this connection.

To the Legal Voters of the City and County of San Francisco.

Prompted alike by a sense of duty to myself and to the public, and in compliance with the request of several hundred citizens, tax payers and friends of the Public Schools, representing the different political sentiments, religious creeds, nationalities and classes of the San Francisco community, I hereby announce myself an Independent Candidate, at the approaching election, for the office of Superintendent of Public Schools.

San Francisco, July 29th, 1867. J. C. FELTON, 5715-5w

And in accordance with law, and an order of the Board of Trustees, made on the eighteenth day of June, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Maurice Dore & Co., No. 327 Montgomery street, San Francisco, on Monday, the nineteenth day of August, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

B. P. WILKINS, Secretary pro tem. Office, 643 Market street, San Francisco, Cal. au3

Neagle & Corcoran Silver Mining Company.

Location of Works: Storey County, Nevada. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of July, 1867, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary of the Company.

Neagle & Corcoran Silver Mining Company. Location: Storey County, Nevada. The Annual Meeting of Stockholders for the above named Company will be held at the office of the Company, Room No. 11, 338 Montgomery street, on MONDAY, the 19th day of August, 1867, at 7 1/2 o'clock P. M., for the purpose of electing officers for the ensuing year, etc. jy20 A. P. OREENE, Secretary.

Nacarra Senara de Guadalupe Silver Mining Company.

Location of Works: Tayoltita, San Dimas District, Durango, Mexico. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twelfth day of July, 1867, an assessment (No. 23), of one dollar (\$1) per share was levied upon the assessable capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, E. J. PEIFFER, at the office, No. 210 Post street, or to the Treasurer, A. H. HEMDMANN, at his office, No. 637 Washington street, San Francisco.

Delays are Dangerous.—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three month's delay requisite in transacting business through Eastern agencies.

Oxford Beta Tuonel and Minlog Company, Esmeralda District and County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of July, 1867, an assessment of fifty cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, or to the Superintendent at the mine.

JOHN F. LOHSE, Secretary. Office, 212 Clay street, San Francisco. j27

Kittleneck Gold and Silver Mining Company.

Location: Brown's Valley, Yuba County, California. Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fifth day of July, 1867, an assessment of one (\$1) dollar per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, No. 318 California street, San Francisco, Cal.

JOHN F. LOHSE, Secretary. Office, 318 California street, Up-stairs, San Francisco, California. j27

Sophia Consolidated Gold and Silver Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirteenth day of July, 1867, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at No. 641 Washington street, San Francisco, Cal.

DAVID E. JOSEPHI, Secretary. Office, 611 Washington street, San Francisco. au3

Senton Mining Company—Location of Works: Drytown, Amador County, California.

Notice--There are delinquent, upon the following described stock, on account of assessment levied on the twenty-eighth day of May, 1867, the several amounts set opposite the names of the respective shareholders, as follows:

Names. No. Certificate. No. Shares. Amount. Wm Ashburner..... 51 10 100 00 Peter H Burnett, Trustee..... 44 10 100 00 E. J. Crano, Trustee..... 45 10 100 00 J. W. Crano, Trustee..... 49 5 50 00 J. W. And in accordance with law, and an order of the Board of Trustees, made on the twenty-first day of June, 1867, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the office of the Company, by Jones & Bendixen, auctioneers, on Thursday, the twenty-sixth day of September, 1867, at the hour of 2 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

This Amalgamator Operates as Follows: The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular way between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pans and constantly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY, 1st San Francisco.

\$85 for Hunter's Improved Concentrator.

The patentee is prepared to sell his Concentrators for the above price, and guarantees, when the machines are run according to directions, to give 20 per cent. better results than from any Concentrator built on this Coast, and will refund the money if they will not perform what is claimed for them. Machines with copper plates, will cost \$10 extra. The Machine can be

Seen in Operation

At Booth & Co's Iron Foundry, up stairs. Parties purchasing Concentrators will do well to examine before buying others of pretended merit. Persons desiring it can have a practical concentration made of tailings at any time, and prove the working of the machine.

FOR \$50.

HUNTER'S EUREKA AMALGAMATOR. For sale, the right to build and use in mills. A working plan will be furnished each purchaser. Five machines can be seen in operation at the Eureka Mill, Grass Valley. The cost of the iron for the machine, without the iron-plate, is about \$10. The box will answer of wood. By reference to the Mining and Scientific Press of May 25th, a full description of the above Machines may be found. For particulars, send for Circulars, or address ANDREW HUNTER, Union Foundry, San Francisco.

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, proceed, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. BLAKE & TYLER, Agents for the Pacific Coast.

QUARTZ MINERS, MILLMEN,

And others contemplating the erection of Reduction Works, for either Gold or Silver Ores, your attention is called to a new, superior

First Class Mill,

In all respects, with Pans and Separators complete. The Mill is adapted for 20 or 40 Stamps.

Full particulars may be had by calling on Messrs. Palmer, Knox & Co., Golden State Foundry, or J. B. HITCHCOCK, Millwright, Russ House.

Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

PICKERING'S GOVERNORS For Steam Engines.

Giffard's Injectors, For Feeding Boilers.

STODDART'S IRON WORKS, Beale Street, San Francisco.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED! MACHINES OF ALL SIZES FOR SALE

WM. P. BLAKE, Corner First and Mission streets, or Box 2,077

NELSON & DOBLE, AGENTS FOR

Thomas Firth & Sons' Cast Steel, Files, Etc., Shear, Spring, German, Flow, Blister and Toe Calk Steel, manufacturers of Mill Picks, Sledges, Hammers, Picks, Stone Cutters', Blacksmiths' and Horse-Shoers' Tools, 319 and 321 Pine Street, Between Montgomery and Sansome, San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.

The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms: No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price \$600 No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour—price \$850 No. 3—Or 21-inch Crusher, will in a similar manner crush from seven to eight tons per hour—price \$1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designed.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size. The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

JAMES BRODIE, Esq., San Francisco.—Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your latest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no objection in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute, in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY ORES.—This Crusher is the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866. BRODIE & RADCLIFF, Express Building, 402 Montgomery street, San Francisco.

LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALED IN THE United States or the world, have been fully tested and found to be the most economical and effective mode of crushing ores in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc. CALIFORNIA REFERENCES.—E. Stockton, Folsom; O. Simmon, Oakland; Mill at Clear Lake; Morcan Coyville, Lexington, Santa Clara County; J. Y. McMillan, Lexington, Santa Clara County. Send for Circular, to KNAPP & GRANT, Agents for California.

26-13-17q 310 Washington street, San Francisco

Quartz Mill Construction and Superintendence

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a Quartz Mill. Has had five years' steady and successful experience in working ores to waste, and is practiced in saving sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address, P. M. 814 W. San Francisco, care Mining and Scientific Press. 26-143m

Notice to Miners, Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE M. Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi styles, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done. M. PRAG, 8-13-1y Store Store, No. 125 Clay street, below Davis.

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

THE CELEBRATED Self Generating Portable Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of from one to three cents per hour only, according to the quantity of light required. It is peculiarly adapted for mining purposes, also for stores, factories, billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivalled, but shines with diminished brilliancy in a strong wind.

Directions for Use.

Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap may now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back, but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vice and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUCK, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 18-14-3n

E. O. HUNT,

Manufacturer of Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HAVE A JUSTIFIABLE WIND MILLS to beat all the sails so arranged as turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person. HUNT'S SELF-REGULATING MILL is strong, durable and cheap. It is provided with means for stopping in the most violent winds. This mill is well known throughout the State.

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double-Acting, Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Tanks built to order. No. 25 Second St., and 108 and 110 Jessie St. 2-15-5y San Francisco.

Golden City Chemical Works.

LABORATORY, Corner of Seventh and Townsend Streets.

OFFICE, Corner of Montgomery and Bush Streets.

CAPITAL STOCK, - - - \$500,000

Trustees: R. P. WAKELEE, THOS. H. SELBY, NICHOLAS LUNING, THOS. BELL, CHAS. E. McLANE.

H. P. WAKELEE, MANAGER.

THIS COMPANY ARE NOW PREPARED TO FURNISH Sulphuric, Nitric and Muriatic Acids of superior quality, in quantities to suit.

Orders will be received at the office on y for Chemicals of every description, which will be manufactured as may be required. The Company beg to say that they have the advantages of all improved machinery and apparatus for the manufacture and manipulation of these products, and our Laboratory is fitted up with the most recent improvements which experience and science suggest, and is surpassed by none in completeness and perfection for the purposes it is designed. 9-14 3m

THE GREAT LIGHT.

THE DANFORD Atmospheric Lamp.

This Lamp burns coal oil, requires no chimney, gives a pure white and steady flame, uses thirty per cent. less oil than any other Lamp, in proportion to the amount of light afforded, and is absolutely indispensable in every house where gas is not used. CALL AND SEE THEM. For sale only by J. W. YERS, 2-15 5y 417 Washington street, opp. Post Office, S. F.

UNSTAMPED LETTERS.—Great inconvenience and often loss is entailed by the unintentional deposit of letters in post offices, without stamps. Some offices, and among others that at Boston, has adopted the plan of affixing stamps at the private expense of the officials connected with the office, trusting to voluntary contributions from the few especially benefited for a remuneration of the aggregate of expenses. The plan was first adopted by Wm. C. Howe, head clerk in the Portland (Maine) office. He has already forwarded at his private expense 1,200 letters since that time, and received from the recipients enough to reimburse him and found a fund for the purpose besides. His example should be followed by every office in the Union.

ICEBERGS are sometimes formed in Lake Superior, in the following manner, as described by the Ontonagon Miner: They commence forming along the lake shore, not immediately on the edge, but varying from 50 to 200 yards from the beach, owing to the depth of water. Near the shore, where the water is shallow, smaller cakes of ice are crowded together, presenting an uneven surface, and so still extending out until the force of the waves in deeper water disparts the further encroachment on their territory. Here the ice forms in a ledge, and the constant dashing of the waves over it, and the congelation of the water, continue to pile up the bergs higher and higher, until at length their summits rise above the reach of the billow element which created them. Some years since a berg was formed near Ontonagon, sixty feet in height from the level of the water. Its appearance in the sunshine was dazlingly beautiful to behold.

NEW ENTERPRISE.—Parties in San Francisco, Benicia and this place, have organized a company for the purpose of building a railroad from Santa Cruz to the headwaters of the San Lorenzo. The officers are: Horace Gnshee, President; S. A. Bartlett, Treasurer; Edmund Jones, Secretary, and the capital stock is \$100,000. The route up the river is being surveyed and will be completed in a few weeks, when the company will commence building the road. This road will open a large tract of country to settlers, at present of no great value, and will give employment to many laborers, besides affording easy access to this port for the large quantities of lumber, lime and other resources of our county, produced on the San Lorenzo and its tributaries.—Santa Cruz Times.

A SINK-HOLE.—Sometime ago a "sink-hole" occurred on the Michigan Southern Railroad in Northern Indiana. It was about 220 yards long, and in order to fill it the company have thrown in two acres of earth, averaging ten feet in depth, three acres of timber and brushwood, the ditchings and scrapings of fifty miles of railroad track for about eight years past, the old ties of about 100 miles of track, and 3,000 car loads of gravel, besides the forty rods of embankment from four to six feet high, that was made before the sinking occurred. At last accounts the hole was about filled up.

PROFITABLE MINING.—The Levant mine, Cornwall, commenced working in 1820, since which time copper and tin ores to the amount of over \$5,000,000 have been returned; dividends to the extent of somewhere about \$1,000,000 have been declared. The largest amount of profit made at any one time was \$21,800, divided in two months. Two of the levels extend beneath the Atlantic Ocean about three-quarters of a mile. The engine shaft is now about 1,700 feet deep from the surface.

THE BORAX COMPANY engaged in taking out borax, in Lake county, will soon be in condition to extract five tons of this article per day from the borax lake, as they have just received a new and powerful steam dredger and an immense pump, with which to exhaust the water from the coffer dams. This pump is rather on the mammoth order, weighing something over 1,000 pounds, and is to be worked by steam.

One of the best uses to which the Atlantic cable is put is the heading off of rogues. Heretofore European and American villains of every kind rushed on board the steamers and were safe. Now the lightning stops this little game, and they are captured the moment they set foot on land.

ELECTROTYPING, ENGRAVING, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

**HYDRAULIC PROPULSION.**—The London Engineer says that it is more than likely that the system of propelling by means of centrifugal pumps will prove very successful in its application to canal boats. The North-moor Foundry Company are now engaged in executing an order for fourteen boats, each of about forty tons burden, the whole of which are to be propelled on the above system.

**TO DETECT FREE ALKALI IN SOAP.**—If the soap contains resin, Pnscher recommends adding neutral subnitrate of mercury to a solution of the soap. To a solution of the soap containing no resin, calomel or corrosive sublimate may be added, which results in the formation of the black sub-oxide of mercury.

**EXTRAORDINARY FALL OF RAIN.**—The most severe rain storm known for years occurred in the eastern part of Massachusetts on the 2d instant. Four inches of rain fell in three hours! Great damage was done to the crops.

**SOLDER FOR STEEL.**—The best solder for fine steel work, according to the American Artisan, is composed of nineteen parts of silver, one part copper and one part brass. Borax is the best flux.

**SUTRO TUNNEL.**—It is reported, says the Gold Hill News of the 5th inst., that work has already been commenced by starting to sink a shaft on the line of the survey, about a mile east of Virginia City.

**BULLION FROM WASHOE.**—Wells, Fargo & Co. shipped from Virginia City, for the week ending August 3d, bullion to the value of \$231,039, and from Gold Hill, \$144,337.

**A DISCOVERY of a rich vein of silver of the highest promise has just been made at the Pizfram mine, Bohemia, at the depth of 400 fathoms, or 130 fathoms below the level of the sea.**

**The colored boys near Corinth, Mississippi, are gathering bullets from the battle fields in the vicinity, and exchanging the lead for spelling books.**

**The Potosi mines in Missouri, ship ten thousand pounds of lead weekly.**

**MINING AND SCIENTIFIC PRESS.**—This valuable journal has closed its fourteenth volume and entered upon its fifteenth. It is a publication that should have a wide circulation among our mining and mechanical population. It publishes, in addition to the most complete summary of mining news, a vast amount of information on the application of science to mining and the mechanic arts. It contains notices and descriptions of all new mining processes, and all machines intended to facilitate the extraction of the precious metal from ore and rock with which it is blended. It also chronicles all new inventions, and, in most instances, contains drawings to illustrate them. To miners and mechanics it is a paper of incalculable value, and should be in the hands of all who desire to keep themselves posted in the progress being made in these departments.—*Price 10 Cents.*

**SANTA CLARA COLLEGE, S. J.**

SANTA CLARA, CAL.

Conducted by the Fathers of the Society of Jesus.

The SEVENTEENTH ANNUAL SESSION of this College will commence on August 23, 1877.

TERMS—Tuition in the Classical and Scientific Department, Boarding and Lodging, Washing and Mending of Articles Washed, School Stationery, Medical Attendance and Medicines, Fuel, Light, Baths, etc., per session of ten months, \$35.

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignace College, Market street, San Francisco.

**HINKLE & CAPP'S CENTRIFUGAL ORE GRINDER AND AMALGAMATOR.**

Patent dated April 10th, 1867.

For Grinding and Amalgamating Charges of Ore.

Arranged as shown in the first engraving, the pan is adapted for grinding and amalgamating separate charges of ore of 300 lbs. each, doing its work rapidly, thoroughly and effectually.

This sectional engraving exhibits more clearly the arrangement and shape of the grinding parts of the machine. It, and the other engravings, will be more clearly understood by reference to the accompanying explanation.

Half Section or Top View.

**The Centrifugal Ore Grinder.**

This new GRINDER and AMALGAMATOR is extremely simple and compact in its construction. The principle availed of is entirely novel. The grinding is effected by perpendicular millers, pressed laterally by centrifugal force against perpendicular iron dies, fitted to the inner sides of the pan. It is to be run at a speed of from 60 to 50 revolutions per minute, according to the hardness of the rock to be crushed. The pressure upon every part of the grinding surfaces is direct and uniform, and they wear with straight and true faces from first to last, conforming also to the shape of the sides of the pan, so that the work performed with old millers and platens is as thorough and perfect as with new ones. The pulp enters readily between the millers and side dies, the pressure being light in front and heaviest at the heel of the miller, there is no strain upon any of the parts, and no liability to breakage or disarrangement, and no wear except that which is useful on the grinding surfaces. The work done is performed without jarring, jerking, straining or clogging, with extreme regularity and evenness, the pulp being of great and uniform fineness. It is not liable to be clogged, nor to be obstructed, stopped, impeded or broken, by coarse pieces of rock, pick points or iron, accidentally introduced with the crushed ore, as these can readily pass each miller separately, without interfering with or affecting the other millers, each of which is independent, or can rest upon the bottom below the millers, without inconvenience, as the arms play freely an inch above the bottom of the pan. It is more readily cleaned up than any other pan, as each miller can be lifted out separately by hand, and there is no necessity of lifting the revolving cone or driver, which is also easily turned, there being no friction when not in use, or rapid revolution. The bulk of the mercury is not ground up with the rock, but lies below the lower ends of the millers in a groove, and in another groove on the cover of the pan, where all the pulp and metal passes continually over it without cutting or carrying it away. The millers and side

For Grinding and Discharging Continuously.

Arranged as shown in the second engraving, all the interior grinding parts being the same as shown in first view, this pan is adapted for receiving and grinding and discharging continuously crushed quartz as fast as supplied by a five-stamp battery, with No. 4 or 5 screens. A "sluiceway," or some similar contrivance, to carry off the clay, slime and surplus water, is to be placed between it and the battery.

**EXPLANATION.**—E, miller-hanger; F, miller plate or shoe; G, side die; I, supporting lip; D, bearing surface; P, feeder; X, weight to counter-balance wear of miller plates, or shoes; T, cover used in working charges of ore. The dark shade on the bottom of the pan represents one of the grooves for mercury.

dies are easily removed at any time, or when worn out, and an extra set of millers is furnished with each pan sold. It is also adapted for grinding cement, sulphurets, roasted ores, etc.

We claim all these advantages for our Pan, and that it will do more and better work, with less power, and less attention and manual labor, more rapidly and with less expense, than any other pan or miller made for the same purposes, and claimed to be of equal or greater capacity. We will sell them for use on condition that, when fairly tried they fall to answer these promises, they may be returned.

For full description and illustration, see Mining and Scientific Press, June 15, 1867.

**Hinkle & Capp's Centrifugal Ore Grinder and Amalgamator**

May be seen in operation, and examined, at the European Metallurgical Works, on Bryant street, between Third and Fourth streets, San Francisco, where all interested in mining and milling operations are invited to inspect it. Its weight, as arranged for continuous grinding and discharge, with extra set of six millers, is about 2100 lbs.; or as arranged for grinding and amalgamating single charges of 300 lbs. of ore, also with extra set of millers, about 3000 lbs. Price, as above, completely fitted and ready for use, either way, \$300, gold coin.

For further particulars, apply by letter to PHILIP HINKLE and CHARLES S. CAPP, No. 513 Clay street, below Montgomery, San Francisco, CAL. or personally to the above, or S. F. KIMBALL, Esq., at the European Metallurgical Works, on Bryant street, between Third and Fourth streets, or at the Miners' Foundry, First street, near Folsom, where they are manufactured.

Send for Circular.

PHILIP HINKLE and CHARLES S. CAPP, Patentees, 513 Clay street, San Francisco.

**Portable Steam Engines!**

"Hoadley's" and "Hittinger's" Make.

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast, for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outermost corners of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world.

All sizes on hand from 3 to 30 horse power, with and without carriages.

Also, Portable Saw and Grist Mill's. For sale by TREADWELL & CO., Corner of Front and Market streets.

**Stair Work of all Kinds.**

Corner of Sansome and Washington sts. SAN FRANCISCO, CAL.

THE STREET CARS PASS THIS HOUSE IN every direction, every ten minutes.

The rooms of the House are well furnished, large and airy, are let by the month, week or day, and are kept in superb order. There is a Restaurant attached for ladies and families, where persons can board for one-half day, are required to pay at hotels.

W-13-6m SANBORN & CO

**Economy in Advertising.**—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

California Academy of Natural Sciences.

REGULAR MEETING.

MONDAY EVENING, Aug. 5, 1867.

Col. Ransom in the chair. Donations to Cabinet.—Dr. Behr presented a peculiar sole fish. Prof. Bolander presented 800 specimens of the flora of Chili, and the Curator of Botany was instructed to provide for their preservation.

Requests were received and referred to the Publication Committee for exchange of published transactions with scientific bodies in Bremen and Stuttgart.

Prof. Bolander gave an interesting account of a trip to Humboldt county, in company with Prof. Whitney. He remarked upon a singular interruption of the redwood forests in the lower part of Humboldt, where he found only isolated and meagre groups, while in Mendocino the redwood belt reaches a width of 40 miles. He had expected as he went farther north, towards an increase of moisture, that the forest growths would rather increase than decrease, and the break he found he thought must be attributed to geological causes, or peculiarity of drainage withdrawing subsoil moisture.

Mr. Bolander described a remarkable elevation in Humboldt county, known as Red Mountain, which consists of hornblende rock, highly impregnated with magnetic iron, the oxidation of which gives a red color to the soil and stains everything it touches. There is a smaller red hill of the same character. Near the larger elevation is a remarkable spring flowing into a swamp, and in this swamp were found several new plants, the families of which even have not yet been determined.

At the conclusion of Prof. Bolander's remarks, a general discussion ensued relative to the distribution of forests, their dependence upon rain, and their influence upon climate. Dr. Cooper, Mr. Davidson, Gregory Yale, and others, participated in the discussion. Dr. Cooper remarked that in one of the Smithsonian reports a paper would be found, showing that the heavy forests are always found in nature where heavy rains prevail, and that here plains almost invariably imply a lack of moisture.

New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Please send your orders, by mail or express, to LYNCH & PARSONS, 25v14-2m8t San Francisco, Cal.

AN INSTRUCTIVE BOOK!

LAYRES'

ELEMENTS OF COMPOSITION,

BELLES-LETTRES AND ORATORY.

For Scholars, Teachers, Lawyers, all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, \$1.00

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, PAOR. LAYRES (a meritorious Teacher of long standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the AUTHOR in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Suet.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Felton.

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—Wm. H. Hill.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining comprehensiveness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—F. W. Hatch.

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—James Denton.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—Caroline L. Atwood.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—I. H. Brayton.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special plunders and as advocates at the forum.—John Curry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America.—S. A. Exactly correct in its arrangement as to be a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Boate.

A gentleman of varied learning and ripe culture, who has had a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained such a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Tuttle.

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—Alta California.

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste, than a general and thorough knowledge of the rules by which the construction of language is governed.—S. F. Tuttle.

Prof. Layres plunges at once "in medias res." He seizes a sentence (which is the unit in composition, whether written or spoken,) holds it up before you; tears it to pieces before your eyes—or rather, we should say, neatly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such exercises, increasing in complexity gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—Mining and Scientific Press.

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—S. A. Examiner.

This is an use in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—Stockton Independent.

The most eminent educators in California give it their hearty approval, and we concur.—Marysville Appeal.

Not only one of the best of its kind, but, what is still better, one of the briefest. It contains 166 pages.—Virginia Enterprise.

Price, \$1. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Address DEWEY & CO., Mining and Scientific Press, San Francisco. 6v16-4f

FIRST Paint Manufactory IN CALIFORNIA.

EPES & E. H. R. ELLERY Have the Patent Right for the Pacific Coast to manufacture, sell and use

Ellery's Patent India Rubber Cement & Paint. It is for all exposed surfaces; impervious to wet; will not rot, peel, blister or crack in any climate. A superior paint for brick, wood, cloth, metals, etc.; successfully used in the Eastern States. The old tin roof of that large building, the New York Rice Mills was in such bad condition it was about to be taken off ten years since. Instead, they put on the INDIA RUBBER CEMENT AND PAINT, making a good tight roof. A coat of India Rubber Paint every two years since keeps it in good condition. We can refer to many others. The Atlantic Lead Works use our Paint only.

NEW CLOTH ROOFS put on; copings and all seams cemented and saturated, then coated with the India Rubber Cement and Paint—the same as on the St. Nicholas Hotel at New York City, the City Buildings and many others, the roofs of all the horse and steam cars, decks of steamboats, etc., around New York—for eight dollars per one hundred square feet. NEW OR OLD TIN ROOFS cemented and painted with the India Rubber Cement and Paint guaranteed, at from one cent to two and a half cents per square foot, according to size and condition of roof. Good men and the best materials used.

We have just cemented and painted old tin roofs of Dr. H. D. Cogswell, Tubbs & Co., D. J. Oliver, etc., and the wood work of Sheriff Davis' building, 83 feet front, on Folsom street, between Third and Fourth streets—only one coat. The work will speak for itself. Now painting the cornice and iron work of Dr. H. D. Cogswell's building, corner of Front and Clark streets—no coat. See the above and other references at our office.

ELLERY'S PATENT INDIA RUBBER CEMENT AND PAINT is composed of India rubber and other gums, dissolved in linseed oil, mixed with the various coloring matters, and ground in any color. When applied to roofs or other purposes, it is mixed with pure linseed oil to the required thickness, and put on as other paints are, with a paint brush—retaining sufficient elasticity to give and take with the heat and cold. Fifteen hundred fishing vessels at Cape Ann use the India Rubber Paint, finding it superior to all others.

EPES & E. H. R. ELLERY are now prepared to make good roofs, and cement and paint new or old ones, and do all kinds of outside painting with Ellery's Patent India Rubber Paint. No asphaltum or coal tar used. Office, No. 226 Jackson street, corner Battery, San Francisco, Cal. 6v15

LIST OF WM. H. KEITH & CO'S Proprietary Preparations.

E. Rum, quart bottles—a superior article; Solution of Citrate of Magnesia; Oranular Effervescent Citrate Magnesia; Cold Cream of Roses; Keith's Chloroform Mixture; Electro-Silicon Polishing Powder; Elsengein Water, Caribada Water, Vichy Water, Seltzer Water.

WM. H. KEITH & CO., 5v16-qr 520 Montgomery st., San Francisco.

Foundry for Sale.

A One-half Interest in the UNION IRON WORKS, SACRAMENTO, Owned by William R. Williams, is offered for sale on the most favorable terms.

A Good Bargain

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lots 85 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets.

Inquire at the office of the Foundry, or address WILLIAM R. WILLIAMS, Sacramento, Cal. 25v13trf-16p

ENLARGEMENT OF THE American Journal of Mining

Volume III, Commencing March 3.

In consequence of the remarkable success that has attended this Journal, the proprietors feel warranted in increasing its size to

Twenty Pages, Thus making it the LARGEST and most COMPREHENSIVE Mining Journal on this continent, representing the Gold, Silver, Copper, Iron, Lead, Coal, Slate, Oil, and in fact all the Mineral interests of America, containing beautiful engravings, illustrating the latest improvements in milling, mining and metallurgical machinery.

The Journal has won the encomiums of the press of the entire country and Europe, and numbers among its contributors more eminent scientific men than any other weekly publication in America.

The reports of the markets in stocks, metals, minerals and ores, carefully corrected weekly, are an important feature of the Journal.

Subscriptions: \$4 per year; for six months, \$2.25—in advance; single copies, 10 cents. Specimen copies sent free. Address, WESTERN & COMPANY, 1v15-lamly Publishers, 37 Park Row, N. Y.

Important to Californians.—Many inventors have lately had their claims for Patents seriously and in some cases fatally delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

W. T. GARRATT, City BRASS AND BELL FOUNDER

Cor. Mission and Fremont sts., SAN FRANCISCO. Manufacturer of Brass, Zinc, and Anti-Friction or Babbet Metal Castings; CHURCH AND STEAMBOAT BELLS, TAVERN AND HAND BELLS AND GONGS, FIRE ENGINES, FORCE AND LIFT PUMPS, Steam, Liqueur, Soda Oil, Water and Flange Cocks, and Valves of all descriptions, made and repaired. Hose and all other Joints, Spelter, Solder, and Copper Rivets, ac. Gauge Cocks, Cylinder Cocks, Oil Globes, Steam Whistles, HYDRAULIC PIPES AND NOZZELS For Mining purposes, Iron Steam Pipe furnished with Fittings, & Coupling Joints of all sizes. Particular attention paid to Distillery Work. Manufacturer of "Garratt's Patent Improved Journal Metal."

Pacific Mail Steamship Co's STEAMSHIPS FOR NEW YORK, JAPAN AND CHINA,

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.

On the 10th, 18th and 30th of each month that has 30 days.

On the 10th, 19th and 30th of each month that has 31 days.

With the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.

Departures of 15th or 19th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton and South America, and P. R. R. Co's steamer for Central America.

The following Steamships will be dispatched on dates as given below:

August 10th—CONSTITUTION, Capt. Jos. Sutton, Connecting with OCEAN QUEEN, Capt. Conner.

August 19th—SACRAMENTO, Capt. J. M. Cavarly, Connecting with HENRY CHAUNCEY, Capt. Oray.

August 30th—MONTANA, Capt. E. S. Farnsworth Connecting with ARIZONA, Capt. Maury.

Cabin passenger berthed through. Baggage checked through—100 pounds allowed each adult.

An experienced Surgeon on board. Medicine and attend as usual.

These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of \$10 to \$20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.

For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.

The Steamship GREAT REPUBLIC, Capt. S. Doane, will be dispatched September 3d, at noon, and will be followed by the CHINA, Capt. George H. Bradbury, October 14th, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting at Yokohama with the steamer OCEAN RICA for SHANGHAI.

For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.

OLIVER ELDRIDGE, Agent.

To Photographers! NITRATE OF SILVER.

Messrs. Falkenau & Hanks—Gents:—We have used the Nitrate of Silver manufactured by you, and find by actual experience that it is, in every respect, equal to the best makes we have used heretofore, both for sepia-toning paper and the Silver Bath. Yours, BRADLEY & RULOFSON, Photographers, 429 Montgomery st.

Messrs. Falkenau & Hanks—Gents:—I have subjected the sample taken from your Nitrate of Silver to a thorough analysis, and find it to be chemically pure, not containing the slightest trace of impurities whatever. Respectfully, THOS. PRICE,

Nitrate of Silver Manufactured by FALKENAU & HANKS, Pacific Chemical Works, San Francisco.

combinations of the elements, at an elevated temperature, and that the interior heat of our globe is residual, no reasonable doubt can be admitted by the mind imbued with the great truths revealed by science.

There is a plan, wise, deep and eternal, extending back, through innumerable millions of ages, deep into primeval time, and the crust of the earth is but the record of successive revolutions, marking the great epochs in the past history of our globe. Before water rested upon its surface, our globe presented a vast body of molten mat-

ter, with the chemical combination, at an elevated temperature, of the elements of which it was then composed accomplished, and the matter arranged, stratum above stratum, according to its specific gravity, subject to such modifications as attend an elevated temperature. The matter of the least density, such as the alkaline metals and their gangue, would be at and near the surface; those metals of greater density and their gangue at a greater depth; while such bodies as are expanded least at an increase of temperature would occupy the molten interior. During that era the earth must have been surrounded by an extended atmosphere, much more complicated in its composition than at a later period, contain-

ing all those bodies that are volatile at low temperatures, such as hydrochloric and carbonic acids, etc.

It will be my object in this paper to note some of the transformations of matter due to the new order of affinities, consequent to the earth having become sufficiently cooled to allow water to rest upon its surface, and also to note some of the changes wrought in the disposition and arrangement of matter due to the mechanical force arising from the contraction of the earth by loss of heat.

If any reader should doubt the igneous origin of our earth, let him consider the following and kindred facts: Silica forms

and were thus kept comparatively near the surface. In consequence of the contraction of matter by loss of heat, thereby leaving the outer coating too large for the shrunken mass it contains, the solid crust of the earth could only follow or adapt itself by corrugating. This corrugation, or breaking up of the solid rock, is attended by volcanic action, and an earthquake is therefore the result of mechanical action in the earth's crust while adjusting itself to the ever-shrinking mass it contains. Many of the seams or fissures which are thus formed are filled with intrusive matter, representing every grade of igneous rock, metallic and non-metallic, stratum after stratum, to the entire thickness of the earth's crust.

When any considerable elevation of a mountain range occurs, it is evident that two systems of fissures would be formed, viz: the summit or anticlinal fissure, and the base or synclinal fissure, and the synclinal fissure might occur upon one or both sides of such elevation. When the crust of the earth had cooled down to the stratum containing the nobler metals, there must have been a period, during which the ores of such metals were erupted, after the manner of the lava in our own era, and the eruptive period must have continued until the metalliferous stratum had, by loss of heat, ceased to be fluid. Now, if the metalliferous stratum remained semi-fluid or plastic for a length of time after the eruptive era, it will appear evident that anticlinal fissures caused by upheavals during such time or period would be filled by such plastic matter; and thus the period, during which any given igneous rock or ore is brought to the surface by volcanic action, might be prolonged.

My mind received the foregoing hint while making a calculation of how much a chain of mountains is upheaved by the formation of an anticlinal vein or fissure one hundred feet in width. We will illustrate by supposing the crust of the earth to be forty miles in thickness—one-half solid, and the under half (twenty miles) plastic. Now let the crust be suddenly upheaved 200 feet along the anticlinal line. If the synclinal fissure be formed forty miles from and parallel with the anticlinal, the summit fissure would open and remain open 200 feet, providing the crust was solid its entire thickness; but the lower half (twenty miles) is plastic, and the great lateral pressure would cause the fissure to close up to 100 feet in width, and there being no unoccupied space below, the plastic matter would be forced upward to fill the fissure, and perhaps form a large cone above the surface. The lateral pressure at the synclinal fissure being at the surface against solid rock, the fluid matter from a greater depth would rise to fill it, after the manner that water rises to fill fissures in floating ice. We shall see, after giving facts that have bearing upon this subject due consideration, that the era during which any given igneous rock is brought to the surface by volcanic action, is not only prolonged, but divided into periods by a whole geological age. We shall see that the ores of the useful and precious metals were erupted or ejected in a fluid state during the old red sandstone period; that the carboniferous era intervened, during which the ores of magnesium, such as bornblende, serpentine, greenstone, soapstone, etc., were intruded along anticlinal lines and non-metalliferous rock from beneath the metalliferous or quartzose stratum, was erupted, and is found interstratified with the formation; and that, from the beginning of the new red sandstone period to the tertiary and perhaps later period, the ores of the useful and precious metals again found their way to the surface by being intruded in a plastic state along anticlinal lines.

[To be continued.]

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Entered according to Act of Congress in the year 1866, by F. A. HERRING, in the Clerk's Office of the District Court of the District of California.]

## Formation, Distribution and Age of Igneous Rocks.

### NUMBER ONE.

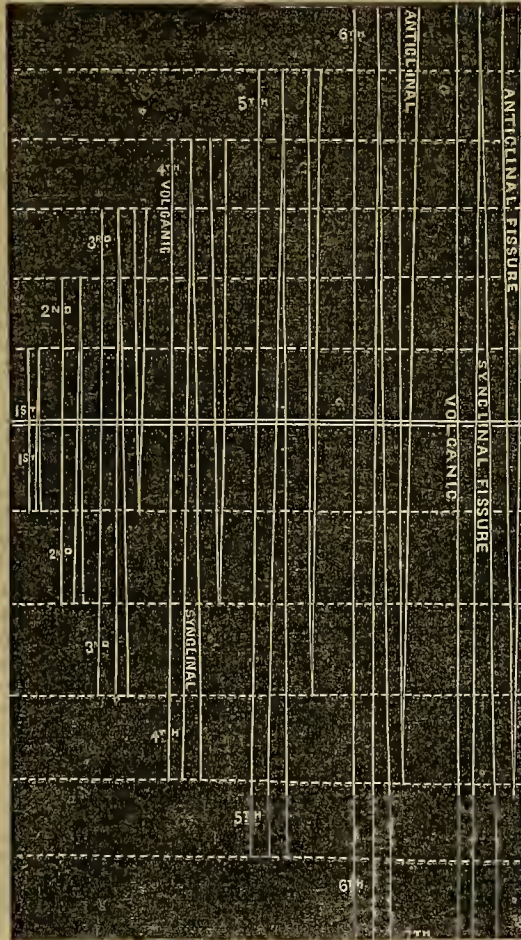

The accompanying diagram is intended to represent the plan of the distribution of igneous rocks. The whole crust of the earth is assumed to be about seventy-two miles in thickness, which is probably not far from the truth. The average thickness of the stratified rocks is supposed to be 42,000 feet. The stratified rocks are divided into six systems of 7,000 feet each in thickness. The unstratified or igneous portion of the crust is also divided into six periods, or strata, of twelve miles each, less the amount brought to the surface to form the stratified rocks. The single perpendicular lines represent the volcanic era of each period; the converging lines represent the synclinal fissures; the diverging lines represent the anticlinal fissures; the oblique lines in the third group of lines passing up through the granite stratum and up through the gneiss, clay state and silurian systems, represent the intrusive era of granite; in the fourth group, feldspathic granite; the fifth, the magnesian rocks; the sixth, metalliferous quartz; seventh, non-metalliferous rock. In forming the diagram, I adopted three initial points—first, the old red sandstone period, as the eruptive era of metalliferous quartz; second, the new red sandstone, as the beginning of the intrusive era of metal-bearing quartz; third, the carboniferous system, as the beginning of the eruptive era of non-metallic rock, as it is in this system the eruptive rock is first found interstratified with the formations. It may not be improper to add that I did not observe until some weeks after making the diagram how perfectly it accords with the chronology of the Bible, as revealed in the Mosaic account of creation.

That the matter of which our earth and all other solid bodies throughout the universe are formed was once in its elementary or gaseous state and pervaded space; that the solid earth is the result of the chemical

[Entered according to Act of Congress in the year 1866, by F. A. HERRING, in the Clerk's Office of the District Court of the District of California.]

the bulk of most rocks. There is but one compound of silicon with oxygen—viz: silica, which is composed of 48 silicon and 52 oxygen, and this compound is the result of the combustion of silicon with oxygen. Silica, or quartz, is the gangue of sulphurets, which are the result of the combustion of metals with sulphur. Quartz is also the gangue of the metals whose oxides are reduced by heat alone.

When the earth was molten from center to circumference, the alkaline metals, being of the least density, existed on and near the surface, or, in other words, the surface rocks consisted of the ores of such metals as sodium, potassium, calcium, magnesium, etc.; and by a wise provision of Nature in preparing our globe for the habitation of man, the more dense of the metals expand more rapidly by an increase of temperature than the gangue in which they are found,

[Continued from Page 82.]  
COAL CUTTING MACHINE.

The coal cutting machine to which I previously referred, exhibited by Messrs. Jones & Brick, and used by some of the coal miners in England, is an important machine, and will, to a great extent, revolutionize the extraction of coal by eaving the necessity of the miner working in the dangerous portions of the drifts—saving life and extracting the coal cheaper and with very much less waste. Although the machine is probably not by any means a perfect one, and is being improved by the different constructors, it already does an amazing amount of economic work, and is generally admitted by the mine owners to be one of the most important adaptations of machinery of modern times.

I visited the coal mines of the Blaiana Coal company, in South Wales, and found several of the machines at work there, as also in the machine shop of the company, several machines in course of construction. Compressed air is employed as the motive power of these machines, and is used to immense advantage, which any one can readily understand must be the case in a poorly ventilated mine, keeping the temperature of the air down in the vicinity of the machine, and enabling the driver to breathe freely in the poor air surrounding him. The labor of the man in charge of the machine is small compared to that of a miner lying on his side, under-cutting, or holeing the coal.

### THE PRACTICAL WORKING OF THE MACHINE.

The thickness of the coal vein in which the machine was employed, under my eye, was about 4½ feet, and I worked the machine, with the pick cutting vertically, horizontally, and at an angle—both in a long face or long work, and in driving or heading. It made ninety strokes with the pick per minute, cutting a hole two feet deep, two inches wide, at the rate of two feet per minute, cutting time, and increasing the depth by a second cut to three feet; being one foot deeper, at the rate of 3½ feet per minute. The average work of the machine, including all stoppages, is about sixty yards per day of ten hours, for long work, against five or six yards for hand labor; and for driving headings it will cut a block five feet square, 2½ feet deep, with four cuts, in *one hour*. I found no difficulty in managing the machine. It is built strong, and will resist the fall of coal on it, as well as the evil designs of most men underground. The machines I saw at work occupied a space 4½ feet long, 3 feet wide, and 2½ feet high, weighing about 1,400 lbs., complete; and worked by compressed air at a distance of about 1,000 yards from the engine. The air was conveyed from the air-compressor by means of 4-inch pipes, reduced as branches are taken off, and ending in 1½ inch pipe and flexible tubing attached to the coal cutter. The pressure of air at the engine was 32 lbs., and at the coal cutter 30 lbs. per inch. But by proper care in thoroughly cooling the air entering the compressor, this difference is materially reduced. The cylinder of the coal cutter is 6½ diameter and 12-inch stroke. The air is compressed by means of two steam engines, having two cylinders 12 inches diameter, under 35 lbs. steam, 15 strokes per minute. The air cylinders are 15 inches diameter, the piston of which is worked by the same rod as the steam cylinder. The air is kept cool by an arrangement of coils. This is found to be very important in compensating for any absorption of heat during its passage to the cutter. These air compressors drive four coal cutters and two or three pumps.

Many parts of the mine, which have been under water in spite of all endeavors to the contrary, are now dry and kept clear of water by pumps driven by compressed air, and which, by means of the flexible tubing, etc., can be moved to any point of the mine with ease and rapidity. The owners of this mine have found this to be of immense advantage, and enables them to drain points

heretofore unworkable, by the ease with which the pumps can be moved from point to point, and the facility with which the compressed air is conveyed to the pumps. The exhaust air pipe becomes rapidly covered with frost from the sudden expansion of the air.

In under-cutting coal by the usual means, much of it becomes almost useless by being broken up and reduced to fine dust, a miner requiring room enough to work and get his body under. In a vein four feet thick, this will amount to about 20 per cent. By the coal cutting machine this is almost entirely saved, as a deep cut two inches wide is sufficient. Slack coal and screenings cost as much to hoist as the best large coal, and are worth about one half as much at the mine; therefore the necessity of getting out sufficiently large coal becomes an important consideration to the mine owner or worker. And again, the use of compressed air, and its material advantage to the ventilation of a mine, in supplying it with a fresh addition of pure air, which, by its sudden expansion reduces the temperature of the mine, especially in the vicinity of the workmen, cannot be too strongly urged, having, in some cases, already obviated the necessity of the use of safety lamps. Another, and the most important consideration in a country where labor is very scarce, is the great economy of the machine in the extraction of the coal, and the fact that these machines do not strike for higher wages.

### Eureka Mine and Mill.

Bean's Nevada County Directory, asserts this to be, as far as developed, the richest gold mine in the world. It was located in 1851, 1½ miles from Grass Valley. The present owners are J. B. Dickinson, Thos. Hope and Benjamin Silliman, of New York, Edwin Hull, W. H. V. Cronise, John C. Winans, Milton Bulkeley, James Freeborn, A. J. Pope, Robert F. Morrow, N. J. Hall, Geo. W. Beaver, L. S. Adams, and Francis Berton, of San Francisco, William Watt, Robert Watt, J. Fricot, A. Pralus and S. Ripert, of Grass Valley. The three Messrs. Watt Brothers have the management of affairs at the mine. They are universally acknowledged to be superior men in this capacity.

The present works comprise the mill, blacksmith's shop, hoisting and pumping room, and drying house. The last named is 20 by 40 feet, in which each under-ground miner has his hook for hanging wet clothing, and a locker to keep his dry clothing in. A separate shaft, containing a ladder for the workmen to ascend from the mine, is covered by this house, where they can assume their dry clothing without first exposing themselves to an improper temperature. This care provided for the workmen by the Eureka company might be profitably imitated by other mining companies in the State.

The shaft now worked is 325 feet, with a 100 foot incline to the lowest level—two compartments. Steel rope, ¾-inch, is used, of California make.

New hoisting works are being erected on a large scale a little higher up the hill. The new shaft has four compartments—one for sinking, one for pumping, and two (with safety cages) for hoisting. Size of shaft, 18 feet 4 inches by 5 feet 3 inches in the clear; angle, same as the lode, about 78°; depth of incline, 500 feet, to be extended to 650 feet. The pillar blocks are to be set with rubber cushions, or springs, to alleviate the sudden strain upon the hoisting rope and connecting machinery, in starting the car, etc. This is the first instance in which we have known of the adoption of this device, which must be a good one. Two 12-inch engines are to be employed to work independently—one for hoisting, and the other for pumping and sinking. The drums are quite large, being 7 feet in diameter, with flanges 13 feet in diameter—the rope is 3½ inch, flat, steel wire, imported by the company. These hoisting works will enable the mine to increase its already large and steady yield of hullion. The lode varies from 2½ to 6 feet, yielding from \$30 to \$70—at an average of \$47.

The mill is about 40 by 75 feet. Has a 45-horse power engine; 20 stamps of 650 lbs. each, run at 60 drops per minute, crushing 40 tons in 24 hours; the screens used in the battery are No. 5, with discharging surface 11 by 14 inches. One brass wire screen, 40 meshes, containing 1,600 openings to the square inch, is used to each battery for water escape, to prevent flooding. The batteries discharge on blankets, which hold 90 per cent. of the gold saved in the mill. The blanket washings are treated in two Attwood amalgamators, the skimmings of which are worked in two Knox pans. These amalgamators are straight, covered boxes, some twelve feet long and two feet square, set at a proper angle. Deep recesses are made across the bottom, which are nearly filled with quicksilver. Revolving shafts, with innumerable iron stirrers, agitate the quicksilver in the riffles, stirring the sand and pulp as it passes through. The Attwood amalgamators are followed by one Hunter's Eureka rubber amalgamator. The blanket sluices are sixteen feet long, and discharge into four of Hunter's rubber amalgamators, which latter, Mr. Watt considers, excellent gleaners. The sands, after passing the amalgamators, are worked in two rockers, 12 feet long by 18 inches wide, in which most of the sulphurets are concentrated. Below the mill there are some 400 feet of sluice boxes, which, by the aid of old gunny sacks, and scraps of all sorts fabric, the attendants are able to glean sufficient sulphurets and amalgam to make their services profitable. The workmen at the mill number 4 rock-breakers, 4 feeders, 4 blanket-washers, 2 engineers, 1 amalgamator, 3 men at the rockers, and 2 at the sluices—total 20, for the twenty-four hours.

Mr. Watt uses a large retort, built upon an improved plan, which we regret not being able to describe.

About ten tons per month of No. 1 sulphurets are saved, and two tons of No. 2. The former yield from \$400 to \$420, and the latter \$250 to \$300 per ton, by chlorination process. No. 1 were formerly sold in San Francisco for shipment to Swansea, for \$282. Now, at a cost about equivalent to freight expenses, to San Francisco, the same quality of sulphurets are made to yield the company \$416 per ton—a saving to California which we take pleasure in noticing.

There are now six chlorination works in and about Grass Valley and Nevada, being an increase of two establishments during the past year. The process is increasing in favor, although it is more applicable to some sulphurets than others.

Mr. Geo. F. Deetken, superintendent of the Eureka Chlorination Works, is meeting with significant success, not only in the treatment of the Eureka sulphurets, but those of other mines, of various character.

Under his direction a new reverberatory roasting furnace has just been erected, of the capacity of four tons per 24 hours. The ores are introduced at intervals through a hopper, from a tramway overhead, at that portion of the furnace farthest from the fire, and subjected to the least heat. Gradually worked forward they reach increased heat, and finally the finishing hearth.

Size of upper hearth, 39 by 6 feet; drop to fire hearth, 8 feet; fire hearth, 6 by 6 feet; finishing hearth, 11 by 11 feet. Two cords of cedar wood are consumed per day, at a cost of \$3.25 per cord. Mr. Deetken's method of introducing salt in the process, is considered by him an important success.

Prof. Silliman thoroughly describes the chlorination (Plattner's) process at the Eureka works, in Bean's Directory of Nevada County, as follows:

This process depends on the fact that the metallic gold is dissolved by moist chlorine gas, while the metallic oxides or chlorides with which it is associated in the roasted ore, are mostly unacted upon. The charge of sulphurets, after roasting, is delivered through an opening in the top of the dome, where a hopper receives them from a tram

wagon. From the time of charging to the completion of the roasting and the arrival of another charge on the hearth is twenty-four hours. The labor required is that of two roasters, or furnace men, one laborer to turn and handle the exhausted ores, and one superintendent. The materials consumed are, for each ton of ore roasted, ten pounds of manganese oxide, fourteen pounds of common salt, and the equivalent of sulphuric acid. The fuel required for roasting is from one cord or less of dry wood in dry weather to over two cords if the wood and atmosphere are damp. A small proportion of salt is used on the hearth with the roasting ore. A dust chamber is placed between the furnace hearth and the chimney to catch the particles of ore carried over by the draft. The roasted charge is moistened after it is sufficiently cool, and is then transferred to a large wooden tub-shaped vat, capable of holding the product of roasting of three tons of sulphurets. This vessel is provided with a false bottom leaving a small void space for the introduction of the gas. The roasted ore is supported on a bed of quartz sand, or tailings, and is sifted in gradually and evenly, care being had that it is neither too dry nor too moist. The gas is started as soon as a few inches of ore are in the vat, the ore being added as the gas follows, until the vessel is filled to within a few inches of the top, when a wooden top is fitted on with flour paste or dough, and the dose of chlorine gas is kept up for about eight hours. Each ton of sulphurets yields about 1,450 pounds of the roasted ore.

The chlorine is produced from the action of oil of vitriol (sulphuric acid) on common salt in presence of peroxide of manganese, in a leaden vessel set over a small furnace. This apparatus is provided with means of agitating the charge during the process, to avoid caking and the melting of the lead. The gas is carried by a lead pipe to an opening left in the lower part of the vat, being washed on its way by water. When the time mentioned has expired, the vessel is permitted to remain until the next morning, when the cover being removed, spring water is suffered to pass through the mass of oxides as long as it washes out any chloride of gold. This solution is conducted to another wooden vat set at a lower level. The first solution which comes over is colored quite strongly yellow with chloride of gold, and so long as the solution, as tested from time to time with a solution of green vitriol, produces therewith the well known greenish-blue color and cloudiness of precipitated gold, the washing is continued. A freshly prepared solution of green vitriol—proto-sulphate of iron—is then permitted to flow into the lower vat until all the gold is precipitated, which settles as a snuff-brown powder on the bottom of the vat, and is finally collected on a paper filter and washed with water until all traces of the iron solution are washed out of it, when its color is blue black, giving an excellent illustration of the change of color in metals due to differences in their physical condition. It is then fused with borax, and gives an ingot of 992 to 996½-thousandths fine. A small trace of gold yet remains in the effete mass of metallic oxides, which is saved by causing this waste material to flow with a stream of water over an inclined plane covered with mercurialized copper plates. The proportion thus saved is not over \$2 per ton of sulphide, and results from particles of gold having a sensible size and which the chlorine has not dissolved. The sulphids of the Eureka mine run from \$250 to \$425 per ton in gold. The silver, amounting to \$10 or \$12 per ton, is lost by the Plattner process, as it is in quantity too small to justify the use of strong brine to save it from the waste as might be done, if it were worth while.

The cost of the whole process, including the salary of the superintendent, does not exceed \$20 per ton of the sulphurets treated.

In the office of the Eureka company, is exhibited a specimen of quartz about two feet in diameter, illustrative of the character of the vein. It is charged with heavy sulphurets, dispersed throughout the ore, with visible free gold; white and gray quartz, alternating with dark streaks, forming what is termed "ribbon" rock. Weight of this specimen about 300 lbs.; estimated value, \$1,000. Mr. Watt showed us various smaller specimens, rich enough to have been termed quartz in gold. Either of these specimens would look well in the MINING AND SCIENTIFIC PRESS Cabinet, Mr. Watt, and had you lent them all to the Paris Exposition, we do not believe California would have been turned off with a silver medal, or, in other words, "damned by faint praise."

## Mechanical.

## Width of Carriage Tracks in the United States.

The question has often been asked, why is there no stated "track" for carriages in this country? Almost every State has different "tracks," and some States have two or three. This causes a great deal of inconvenience as well as expense in altering the "track" to suit the locality where the carriage is used. There does not seem to be any need of this, and we do not believe a good reason can be given why it should be so. It has been suggested that the manufacturers of carriages should get together and agree upon some width of "track," taking pains to adopt one that would be suitable for all classes of work, and allowing a sufficient width of body without bringing it too close to the wheel, there would be but little trouble in having it adopted in all sections of the country. If this could be brought about, the trouble it would save to carriage manufacturers in one year would more than pay for all the cost. At present, some eight different "tracks" are used in the New England States alone; New Hampshire and Vermont using the four feet eight inches track, Massachusetts, five feet two inches, and Rhode Island, five feet five inches. The Connecticut car track is four feet ten inches, while the carriage track in New Haven is four feet eight inches; in Hartford, four feet ten inches. In the eastern part of New York the gauge is four feet eight inches, while in the western part it is from four feet six to four feet ten inches. The New Jersey track is five feet, except in the northern part of the State bordering on New York, where they compromise the matter by using the four feet ten-inch track. The Southern track is generally five feet, while in the Western States there appears to be no fixed width.

This is not only a great inconvenience to the carriage manufacturer, but also to the purchaser. If we buy a carriage in the eastern part of Connecticut, unless we give an order to the contrary, it is made to track five feet, or if we go to Massachusetts, it is still wider, being five feet two inches. This ought not to be, and it is to be hoped that this subject will be agitated among carriage manufacturers until some uniform width of track will be adopted all over the country. Very much injury is done to light carriages by driving in sections where the "track" may not be more than one inch wider or narrower than at the place where the carriage was made. This objection is particularly apparent in the spring and fall, when the roads have been cut up by heavy wagons into deep ruts. The wheels of the light carriage will follow these ruts, causing the springing of the axle or injuring the wheels. In either case the owner of the carriage is disposed to blame the builder. Let a uniform track be established, and manufacturers will not have their patience tried by careless customers.

WHEN an undershot water-wheel is not required to work in both directions, it appears, from the experiments of De Parcieux and Bossut, that a decided advantage is gained by inclining the float-boards towards the advancing stream, at an angle of 20° to the radius of the wheel. The water then becomes partially heaped up on the float-boards, and acts by its gravity as well as its momentum. They also leave the retiring stream with less resistance.

A PROCESS has been patented in England for effecting the reduction of metallic ore into steel or iron, under the influence of intense surface heat, by regulating streams of petroleum or other volatile mineral oils, either by themselves or in combination with forced currents of permanent carbonaceous gases transversing the mass of ore under operation.

It has been proposed to decarbonize and purify cast iron by employing gases as the agents for the production of heat, and as re-agents on the liquid cast iron. The reactions are produced by effecting a series of oxidations and reductions. The chief agents to be employed are water, steam and the reducing gases.

A COOPERATIVE furniture factory, with a capital of two million dollars, and employing six hundred men, most of whom are stockholders, has gone into operation at Cincinnati.

IMPROVEMENT OF STEEL AND IRON.—Mr. C. A. Winter communicates the following to the *American Journal of Mining*: "Some few years ago, experiments were made in Germany, especially in Austrian works, to alloy steel and cast iron with wolfram, for the purpose of improving its adaptability to future manipulation. I have recently obtained these results, and take the liberty to publish the same, as they may be of interest to the iron-works of this country. At present, I briefly give the results, but all further information concerning the manner of carrying out this process is at the disposal of any person interested who might wish to test the nature of this process.

"By the addition of wolfram, puddled steel obtains the homogeneity and hardness of cast steel; its grain becomes hard and fine, and cannot be distinguished by its fracture, nor in its appearance, after being worked up from cast steel. At the same time, it becomes extremely tenacious, malleable (textile) and easily welded. The cost of production of puddled steel is much cheaper than that of cast steel: furthermore, puddled steel alloyed with wolfram is as well, and in some cases better adapted than cast steel for the subsequent manufacture of locomotive and wagon ties, files, saws, mint-dies, corers and edge tools, weapons, etc. The addition of wolfram in the puddling of raw iron has also yielded the most favorable results, since puddled iron, alloyed with wolfram, is adapted to the manufacture of wire and sheet-iron, and especially the armor plates for ships.

The same beneficial effects have been obtained in its application to casting raw iron for cannons, cannon balls, axles and other portions of machinery, propelling screws and rollers, which should be very strong and hard."

A MODEL arial machine has been exhibited in France, which, by purely mechanical force, carries a mouse through the air. A sanguine and patriotic critic declares that France has solved the difficulty of arial navigation, and that a machine proportionally large will raise an elephant much more easily than the model bears its tiny traveler.

A FACTORY has just been put in operation in Philadelphia for the manufacture of carpet from hemp. The material resembles Russia crash, and is printed like calico, one side only being available. The company who have commenced the production will put their goods immediately in the market.

It is reported that Krupp has offered his monster cannon as a present to the King of Prussia. It is valued at about \$100,000.

It is said that a million of dollars is annually made by the sale of Florida cedar wood for lead pencils.

A MAGNIFICENT SIGHT.—The *Copper Falls Gazette* describes a mass of copper now visible at the Copper Falls mine, Lake Superior, as follows: "Imagine a cave thirty feet or more wide, 100 feet long, and in the tolerably level part the floor covered with large loose blocks of copper and rock. The roof is from ten to twenty feet high, and pendant from it hang the ends of huge masses. Looking north along the west, or foot wall side, the roof was highest, and the stalactical points of copper longer and finer than on the other side of center. On the east, or hanging side, a huge mass of copper and rock, thirty feet in length, hung down almost to the bottom of the stope, looking as if it alone would produce a hundred tons or more of metal."

SALT.—The *Havilah Courier* says that the soda or salt lake in Tehachapi Valley have been taken up by Messrs. Narbo. The salt obtained at this lake is of superior quality and the yield abundant. It is expected that 100 tons will be obtained this season.

THE St. Joseph (Mo.) *Herald* says that a nugget of gold, valued at \$182, was recently dug out of a hill near that place, creating quite an excitement among the miners. If such was the case, it was no doubt lost or deposited there by some returned Californian.

Two hours reading of a good newspaper is as profitable as six hours work out of twelve. The farmer and produce dealer equally should understand the markets. Sometimes to know a thing is the same as to earn \$100.

## Scientific Miscellany.

## Evaporation and Condensation—The Sun's Power.

The entire surface of the earth comprises about 200,000,000 of square miles. Of this amount, about 150,000,000 (or three-quarters) is covered with water. Over this vast area there is ever an atmosphere highly charged with aqueous vapor; and as this moist atmosphere is borne along by the winds whenever it encounters a sufficiently cold current, a condensation takes place, and we have rain. The greatest amount of condensation (and consequently of rain), however, takes place when these moisture-charged currents reach the land, and especially the highlands or mountains. In addition to the condensation due to the increased coldness of the land currents, the electrical state of the atmosphere is also more or less charged when it passes from the sea to the land, rendering the atmosphere more or less able to retain its moisture. The vapor, as it rises to a cooler atmosphere, is gradually changed to light, fleecy clouds, the clouds growing gradually heavier and darker, by the gradual multiplication and increase of the vapor molecules, until the atmosphere is no longer able to sustain them; they then fall in rain or snow. Nearly all, probably eight-tenths, of the rain or snow that falls upon the land, comes originally from the sea, from whence it is taken as an invisible vapor. The rain that falls in a single year on the land would, if accumulated in one body, cover its whole surface to a depth of fully three feet. Probably not less than eighteen, or perhaps twenty, inches in depth of water over the entire surface of all the ocean, is elevated into the clouds every year, to fall again, chiefly upon the land, to fructify and invigorate the earth, and to keep in constant flow those great interior arteries of commerce, which everywhere pierce far inland from the ocean shores to the distant mountain regions of the dry land.

How immense and incomprehensible is the power by which this is effected; and yet how silently and imperceptibly does it work! Equally as subtle, equally as incomprehensible, and equally as great as that other power of our central luminary, which keeps the whirling planets in their distant orbits, is this power of heat, by which the earth is warmed and the rivers made to keep up their unceasing flow to the ocean. The sun's attractive force is exerted or affected by only now and then a mere point in the distant space surrounding that body—points occupied by a few wheeling planets and plunging comets. But the influence of the sun's heat, however, passes off in every direction through space. The vast power which it represents must be calculated by multiplying its effects upon the surface of our globe into the effects which would be produced upon the surface of a globe whose diameter would be equal to the diameter of the earth's orbit! The mind is completely lost in such a computation, and can only reflect with wonder and awe upon the majesty, power and goodness of that Being who has created a universe, the proportions of the magnitude to which our system of the sun and planets represents, is but as a grain of sand upon the sea-shore to the vast world we inhabit!

INTERESTING ELECTRICAL FACT.—It is an interesting fact, though one not generally known, that the flame of a blow-pipe is from twenty to thirty times more electric than an ordinary flame. The remarkable conclusion has been come to that there is a voltaic current, and one of no mean intensity, due to flame, and not dependent upon thermo-electricity, or electricity developed by heat. It is believed that by attaching to a powerful pair of bellows a tube from which a row of jets proceed and alternating pairs of platinum in flames urged by the jets, a flame battery might be obtained which would produce chemical decomposition, and all the usual effects of the voltaic pile.

THE FIBROUS NATURE OF IRON.—M. Fresco, who has experimented considerably with regard to the flow of solids, has now recently occupied himself in observing the mechanical construction of metals. He produced at a late meeting of the Academy of Sciences at Paris, several specimens of iron bars carefully oxidized on one side, in order to prove that these bases consisted of an assemblage of distinct fibers, each originating in one of the parts which existed separately in the original mass before pressure was applied. Each fiber could be distinctly traced by the aid of the magnifying glass from one end of the bar to the other.

FRUIT FLAVORED AT WILL.—It is said that a gardener of Ghent has, after many trials, succeeded in giving any kind of fruit the flavor he pleases while it is still on the tree. Let us take an apple for instance; he pricks it rather deeply in four or five places with a large needle, and then lets it dip for a while in a bowl containing a liquid possessing the flavor he wishes to communicate. After a few seconds this liquid will have penetrated into the pulp; and this operation being repeated two or three times at intervals of eight or ten days, the apple is left to ripen on the tree, and will subsequently be found to have acquired the taste either of strawberry, raspberry, cloves, etc., according to the liquid employed.

POWER OF BIRD'S SONG.—When we hear the song of the soaring lark, we may be sure that the entire atmosphere between us and the bird is filled with pulses, or undulations, or waves, as they are often called, produced by the little songster's organ of voice. This organ is a vibrating instrument, resembling, in principle, the reed of a clarinet. Let us suppose that we hear the song of a lark elevated to the height of 500 feet in the air. Before this is possible, the bird must have agitated a sphere of air 1,000 feet in diameter—that is to say, it must have communicated to 17,888 tons of air a motion sufficiently intense to be appreciated by our organs of hearing.—*Tyndall's Glaciers of the Alps*.

A MAGIC RIVER.—In the province of Andalusia, in Spain, there is a river called the Tinto, from the hues of its waters, which are as yellow as topaz. If a stone happens to fall in and rests upon another, they become perfectly united and conglutinated. All the plants on its banks are withered by its waters whenever they overflow. No kind of verdure will come up where its waters reach, nor can any fish live in its stream. It is oxide of mercury and iron in solution; hence their destructive influence on fish and herbage.

THE scientific advancement of which the present age is now weary of boasting, is, in reality, the work of comparatively few minds. The inventors and discoverers of scientific truths are few in numbers, and, with a few noted exceptions, seldom reap much of either the honors or profits of the labor of their brains. Inventors and scientists are seldom practical men.

A NEW idea in photography has been brought out at the East—viz: to take the head of a lady in the midst of the petals of any kind of a flower—a rose, tulip or lily. The profile appears almost smothered in a beautiful and highly-colored flower, with a long stem attached, looking as natural as if it had grown there.

TO OBTAIN FRUIT WITHOUT STONES.—The latest horticultural device is that of removing the stones from fruits by a process of gradual reduction, by extracting the pith from shoots and grafting them on stocks and their own branches for successive seasons. It is said that the experiment has been perfectly successful with the Malaga grape.

AN ARSENIC MINE.—T. T. Garrett, an off and on resident of this city, says the *Marysville Appeal*, has been prospecting in the Coast Range for nearly eight years for minerals of various kinds. He has searched for gold, silver, copper, oil, etc., and has succeeded in discovering copper and soda, and believes he is also the lucky finder of a cinabar ledge. Mr. Garratt recently selected samples from his supposed quicksilver mine and sent them to a friend here for analysis. These samples were taken to Knight & Co's assay office yesterday and reduced by Mr. Aaron and found to be sulphuret of arsenic.

RATS.—An army of hungry rats recently made a raid on the hog pen of a farmer at Sumner Hill, N. Y., and killed and nearly devoured a hog weighing 200 pounds.

### The Empire Quartz Mill.

One mile from Grass Valley, on Ophir Hill, near the Colfax road, stands the finest and most complete quartz mill in California. It is owned by the Empire Mining Company. The building, 90x100 feet, is painted white, presenting a neat outward appearance. Everything looks new and in regular proportion throughout its interior. The machinery consists of an 85-horse power engine, one large size Blake's crusher, thirty 750-pound etamps, sixteen five-foot Baux pane (modified), seven five-foot Knox pans, six eight-foot settlers, one Hendy concentrator (four more being lately ordered). The rock is dumped from cars in front of the crusher. The amount crushed in twenty-four hours—fifty tons—is run through the crusher in eight hours, falling below in a convenient place and condition for feeding into the batteries. The stamps drop sixty-three times per minute. Screens, No. 40, 960 holes to the inch, with discharge surface ten inches high. Two amalgamators, consisting simply of riffles and revolving stirrers (similar to those used in the Attwood amalgamators) are placed close to the batteries. Next are sluices, containing the blankets, upon which the sulphurets and heavy sands are caught. These latter are taken from the bottom of the vats in which the blankets are washed and ground in the Baux pans, which are set in a row just below the sluices. The modifications in these pans consist in enlarging the mullers to eighteen inches in length and two inches in thickness, discarding the covers and adding a concave rim some six inches wide to the top. They are run at thirty revolutions per minute. Below these pans stand the settlers and Knox pans, which are run at twenty revolutions per minute.

We were told by the amalgamator that Hendy's concentrator, which had been run some two months, and its operation well understood, was giving excellent satisfaction. It was being continually tested by comparing the yield of the sulphurets from the batteries leading into the concentrator with the yield from the blanket washings from other batteries. The gold from the concentrated sulphurets invariably exceeded that obtained from the blanket washings. By the introduction of five more Hendy concentrators, it is calculated that four pans (in place of sixteen) will be all sufficient for grinding, thereby greatly reducing the power necessary for running machinery, besides eaving the labor of washing blankets and attending a large number of pans. The introduction of a full complement of Mr. Hendy's machines in this mill, after a careful trial and upon its own merits, as we are fully assured, is certainly a high recommendation.

The engine room occupies about twenty-five feet square of this mill. Engine, 85-horse power; 18-inch cylinder and 4-foot stroke; fly-wheel, sixteen feet diameter, weighing 1,750 pounds. Two tubular boilers, forty-six inches by sixteen feet, occupy an additional building, a little larger than the engine room. Boilers supplied with patent injectors, by Stoddart. Usual weight of steam, fifty-five pounds, although thirty-five pounds will run the whole works. Five cords of wood are consumed per twenty-four hours.

The amalgam room occupies about 25x25 feet, contains three small prospecting pans, and a full complement of other fixtures, well arranged to facilitate this portion of the work. A hose is attached to a steam pump of sufficient force to extinguish a fire in any part of the mill. The firm manner in which the fine engine, and in fact all other machinery about the mill, is set and operated, affords a pleasant sensation to the visitor in contrast with the agree-like propensity exhibited by old quartz mills in general. Everything seems to be arranged with a view to convenience and economy in time. Only seven men are employed at a

time about the mill—one at the crusher, two feeders, three blanket-washers and amalgamators, and one engineer.

The Empire mill is supplied with ore from two shafts—one at the site of the old mill (now used only for hoisting and pumping purposes), and the other at the new hoisting works. Both are within 100 yards, and connected with the mill by a double tramway.

The new hoisting works occupy a building 50x50 feet. The power is a 50-horse engine, with Corliss' patent cut-off. The incline is 500 feet deep, and the engine raises about six inches of water and 350 car loads per twenty-four hours, consuming only one and a half cords of wood. The shaft has separate compartments for pumping, hoisting and lowering. Drums four feet diameter with five-foot flanges. They act independently, raising and lowering at the same time. At the old hoisting works, the incline is 600 feet. Some 250 car loads are raised daily. Two men only are employed at each of the hoisting works.

The ore from this mine averages at least from \$40 to \$50 per ton. The lode has been proved a distance of 1,500 feet. Will soon have opened up 200 feet of backs 300 feet along the 675-foot level. Ledge at the bottom of the shaft two and a half feet wide, apparently of the best class of ore.

The company own 2,000 feet of the lode, the mill being located in the center of the claim. They have also in their possession 5,000 feet of an adjoining parallel lode. Captain S. W. Lee is general superintendent at the mine, and under his direction the present works were erected. The owners are, J. P. Pierce, A. L. Morrison, A. H. Houston and Captain S. W. Lee.

**SAFETY CAGES.**—Several recent writers in the London *Mining Journal* have expressed the opinion that the numerous efforts of modern invention to prevent accidents, in ascending and descending mining shafts, rather have a tendency to increase them, for the reason that they tend to cause carelessness on the part of those whose neglect they are intended to compensate for, and the mischief they are intended to prevent is often produced by their cutting or breaking the guides, etc. One writer says: "I believe that every year we are going further back, rather than improving, in consequence of the increasing effort on the part of the public to render compulsory the use of scientific and theoretical safety apparatus, which, in the hour of need prove themselves to be worthless, and the decreasing inducement, through this interference, to employ really competent and intelligent workmen for responsible duties." One of the most prolific causes of such accidents appears to be "over-winding." There is too much of a desire to save time. The usual speed of an ascending cage is often so rapid that it cannot be stopped in less than thirty feet; hence, a slight miscalculation often results in some terrible disaster. One hundred feet of winding per minute, or but little in excess of that, is given as the utmost speed consistent with anything like a fair degree of safety.

**OUR FUTURE.**—The States of the Pacific Coast are as populous and wealthy as were the whole Colonies in the time of the Revolution. California produces more flour, and Oregon more butter, than they can eat, to say nothing of their mineral productions. Added to this, when we take into consideration the immense superiority in the engineering for political and social progress which we now possess, over that enjoyed at the commencement of our national existence, who can predict the progress which the Pacific Empire will make before the middle of the next century?

**HENDY'S PATENT CONCENTRATORS** are getting a fair start at Grass Valley, Nevada county. The four put up at the Forest Spring mine, we are told, are doing well.

**THE LATE METEOR IN OREGON.**—A correspondent writing from Monmouth, Oregon, Aug. 6th, gives the following account of the brilliant meteor recently seen in Oregon, and of which the papers have given a very imperfect account:

About eight o'clock on last Wednesday evening, (July 31st), a body about one-fourth the diameter of the full moon, and of a bright red color, suddenly appeared in the eastern sky, at an elevation of about 15 degrees above the horizon, and moving slowly in a northwesterly direction, constantly keeping at about the same elevation. In about half a minute from the time it was first observed, it seemed to explode, about one-third of the mass falling slowly behind, while the remainder kept on its course, assuming a hairy appearance something like a small comet, and for a moment emitting sparks like a piece of hot iron, when struck. After a few seconds, the smaller portion was again divided into two parts, both of which started downward and soon disappeared. The larger mass kept steadily on in the same direction for about two minutes, when it disappeared behind a mass of clouds in the north, and was seen no more. No one here heard any sound at the time, and though observers at Salem and Vancouver speak of it as much larger than it appeared to us at this point, yet no one speaks of hearing any sound. Several small meteors fell within a few minutes after the disappearance of the large one, but their appearance was not unusual.

**CHLORINATION WORKS IN SIERRA COUNTY.** Chlorination works have just been put in operation at the Gold Valley mines, near Downieville, in Sierra county. Mr. G. H. Gray, the Superintendent of the mine, and one of the proprietors, writes us that the first batch of two tons of sulphurets have been put through the works, with a most satisfactory result. These are the first chlorination works in Sierra county. The mine on which they are located contains an unusually large percentage of sulphurets, and cannot be worked to a profit by any mere mill process, as the proprietors have learned to their cost. A lot of the rock was sent down to this city, some time since, and worked by Mr. Mosheimer, at his works near North Beach—the sulphurets being concentrated and subjected to the chlorination process. The result was so satisfactory as to induce the proprietors to proceed immediately to the erection of similar works at the mine. Mr. Gray, having thoroughly acquainted himself with that process by a course of instruction under Mr. Mosheimer, has since superintended their erection, and has put them in operation, with the above satisfactory result. There are, no doubt, many other mines in this State whose yield might be largely increased by similar management.

**SCIENTIFIC AGRICULTURE.**—It is said that France obtains 50 per cent. more wheat per acre than the United States, and that England exceeds our yield by more than 100 per cent. The difference is altogether owing to superior cultivation and manuring. The soil of the wheat growing districts of this country is naturally more productive than that of either France or England. The wheat growers of the United States wear out a natural soil in about twenty-five years, and then move to a new locality. The time has about arrived when any further removals will place our Atlantic friends at too great a distance from a market to make wheat raising a paying crop for transportation. The former will then be compelled to resort to the aids of science, which he now generally effects to despise. Would it not be well for our California wheat growers to consider these facts. The method of wheat culture in this State is more extravagant and improvident than that practiced in any other country on the globe.

**MINING SECRETARY.**—The special notice concerning a situation as mining secretary, which appears in this paper, relates to a gentleman of ability who has the highest recommendations. A portion of his time only being occupied now, he wishes to make a further engagement.

### Order Bussey's Combination Burglar and Powder-Proof Keyless Lock!

#### REASONS WHY.

- 1st. It is the best Combination Lock known.
- 2d. It is impossible to pick it.
- 3d. It can be subjected to over half a million changes, and when run by a burglar, be no nearer entrance than when he began.
- 4th. It has no key to lose.
- 5th. The more it is used the better it is liked.
- 6th. It has no signs, letters or figures, on its face.
- 7th. It is the simplest to understand.
- 8th. It is impossible to open it without knowing the set.
- 9th. It is least possible to get out of repair, as any one will be convinced on examination.
- 10th. It is the strongest Lock.
- 11th. No possible derangement of combination can be made.
- 12th. Amador County has adopted this Lock for its safes.
13. It received a special premium at State Fair

#### Opinions of the Press and others in regard to Bussey's Combination Lock.

The Bank of British Columbia ordered the first one of these locks introduced in this city, and the following recommendation has been received by the inventor:

BANK OF BRITISH COLUMBIA,  
San Francisco, May 24, 1866.

Recently, two of Wm. C. Bussey's new Patent Combination Burglar-Proof Locks were placed upon the vault doors of the Bank of British Columbia. They are found to operate with all the efficiency claimed by the inventor, and in every way meet our fullest approval.

They were ordered upon mature deliberation, after strict investigation of their merits, in comparison with some of the most noted and popular old styles of combination locks.

We deem the lock entirely burglar-proof. It is strong in construction, without intricate or delicate parts, with simple and easy movement. We find no difficulty in either opening or closing it, nor in changing its combinations, which may be made almost innumerable.

As a California invention of extraordinary merit, we take pleasure in recommending it to public attention, believing it to possess all the advantages which are claimed for it.

WM. H. TILLINGHAST, Sub-Manager.

We do hereby certify, that Wm. C. Bussey's Combination Lock is the best Safe Lock in existence, and impossible to be picked. We have applied several to Vaults and Safes, to entire satisfaction to parties interested.

KITREDGE & LEAVITT,

Pioneer Iron Works, cor. Fremont and Market sts.

SAN FRANCISCO, May 6, 1867.

I do hereby certify, that Mr. Wm. C. Bussey's Combination Lock is the simplest and strongest in construction, and the least possible to get out of repair; and for Safes and Vaults in every other respect as good as any other improved combination lock which I am acquainted with.

JOHN R. SIMS,

Vault Manufacturer, Oregon street.

JACKSON, April 27, 1867.

I, the undersigned, Sheriff of Amador County, do hereby certify that I am using one of Wm. C. Bussey's Keyless Combination Locks on my safe, which is made to draw four bolts with facility. I believe the lock to be the best lock ever invented, for the following reasons:

1st.—Because it is impossible for either burglar or expert to pick it.

2d.—The lock being constructed without a key-hole, it cannot be blown to pieces by powder.

3d.—There is no possibility of deranging the combination by breaking off, or attempting to drive the knobs into the safe. And it is in fact the nearest approach to perfection yet arrived at in the art of Lock making.

R. COSNER.

Attested by J. C. SHEPMAN, County Clerk.

JACKSON, April 27, 1867.

The undersigned, Treasurer of Amador County, do hereby certify, that I am now using one of Wm. C. Bussey's Keyless Combination Locks. It is fastened to the outside door of the Treasurer's Safe. I have no fear of any bystander gaining a knowledge of the set of the combination, when locking or unlocking the same. If I desire to have access to the safe every few minutes, I can so adjust the combination as to open this lock in two seconds of time. I am exceedingly well pleased with the same, and I deem this lock to be all that the inventor claims for it.

OTTO WALTHER.

Attested by J. C. SHEPMAN, County Clerk.

**CALIFORNIA LOCK AHEAD.**—A special premium was awarded Mr. W. C. Bussey, for his superior Combination Powder and Burglar-Proof Safe Lock, at the recent State Fair. We are sure no award was ever more meritoriously bestowed. This Lock was described at length in the Press several months since. At that time it was adopted by several banking houses in this city, and we are now assured that the remarkable claims asserted in favor of the Lock at that time, have been confirmed since by its practical use. We feel an interest in this California invention, and wish to see it speedily meet with the success it is ultimately certain to attain. Mr. Bussey, having properly first fairly tested his lock in California, is now desirous of introducing it in the East, and offers to dispose of the right for several States at very reasonable rates.—[Mining and Scientific Press, Sept. 29, 1866.]

They are the only SAFE lock ever invented. Every State and County treasury vault, and every bank and business place should have one.—[Amador Ledger.]

This is a lock in which a number of rotating annular tumblers is employed, and it consists in a novel arrangement of such tumblers in connection with one or more arms connected with one or more bolts. whereby an extremely simple and effective lock is obtained, presenting an almost unlimited number of combinations. For which he was awarded a special premium at the State Fair.—[Sacramento Union.]

We, the undersigned, practical Locksmiths, unhesitatingly pronounce Bussey's Improved Combination Burglar Proof Lock to be the most reliable lock constructed.

F. MARKT & C. FLETCHER,

No. 18 Post street.

C. H. INGALLS, } Supervisors.  
L. McLAIN.

Any good locksmith can put this lock on safe doors. Boxed or single old locks removed and this placed in their stead, to work one, two, three or four bolts, as the case may be.—[See page 30 in Pacific Coast, whereby an expert deaf blind man can open this lock when he knows the set and understands the full manipulation, without any expert detecting the combination.]

MINING SHAREHOLDERS' DIRECTORY.

[Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.]

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Table with columns: NAME, LOCATION, AMOUNT, and DATE OF ASSESSMENT. Lists various mining companies and their financial details.

Table of Retail Prices for various commodities like Coal Oil, Butter, Eggs, etc., with prices per gallon or pound.

San Francisco Metal Market.

Table of Prices for Invoices for various metals and alloys, including Tin Plates, Sheet, and other metal products.

\*Those marked with an asterisk (\*) are advertised in this journal.

Latest Stock Prices Bid and Asked.

Table of Stock Prices for various companies and bonds, including United States 7-10ths Bonds, San Francisco City Bonds, etc.

San Francisco Market Rates.

Table of Wholesale Prices for various commodities like Flour, Sugar, Coffee, etc., with prices per barrel or pound.

NEW INCORPORATIONS.—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

SOUTH SAN FRANCISCO DOCK CO.—San Francisco, Aug. 7th. Capital stock, \$500,000; 500 shares, \$1,000 each. Trustees: Henry B. Brooks, J. DeForest, L. Williams and H. Rosekrans.

ELECTION OF OFFICERS.—LABORERS' UNION BENEVOLENT ASSOCIATION.—Aug 5th. Trustees: D. F. Driscoll, John Cronan and Patrick Heffran. President, Wm. Simpson; Vice-President, John Green; Treasurer, Mathew Clarke; Financial Secretary, James Callaghan; Recording Secretary, John Coogan.

CO-OPERATIVE UNION ASSOCIATION.—Aug. 8th. President, B. H. Freeman; Treasurer, H. F. Williams; Secretary, Addison Martin.

PHILADELPHIA SLIDE G. & S. M. Co.—Aug. 14th. Trustees: A. H. Baily, E. H. Taft, S. Klein, E. R. Haully and J. E. Magary. President, A. H. Baily; Secretary, F. Creighton; Treasurer, S. Klein; Superintendent, Wm. T. Gibbs. Office, 208 Sansome street.

MILLSTONE MANUFACTURE.—Mr. C. F. Travis has recently commenced the manufacture of French burr millstones, at 109 Mission street, in this city—a branch of business, we believe, never before introduced on this coast.

WOODWARD'S GARDENS.—This charming place of suburban resort will be open today, and the proceeds of the day will be devoted to the San Francisco Benevolent Association.

THE UNION PACIFIC RAILROAD.—The Union Pacific Railroad is now opened to Julesburg, 376 miles west of Omaha, and the daily trains have commenced running each way. Over 600,000 pounds of freight was awaiting the opening.

MINING IN CORNWALL, of every description; appears to be at a very low ebb at the present time, and various speculations are being indulged in as to the most ready and effectual means for resuscitating it.

AN INSTRUCTIVE BOOK!

ELEMENTS OF COMPOSITION, BELLES-LETTRES AND ORATORY.

Prof. LAYRES' For Scholars, Teachers, Lawyers, all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, \$1.10

This is a new publication, and is stylo and treatment of the important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner,) in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—John Stead.

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—J. C. Pelton.

After a careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for clearness and simplicity of style, it would be worth the while, without a rival. I regard your work as the best of its kind. I know of but few men in my profession who would not be benefited by its careful study.—Wm. H. Hill.

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal clearness and simplicity of style, it would be worth the while, without a rival. I regard your work as the best of its kind. I know of but few men in my profession who would not be benefited by its careful study.—Wm. H. Hill.

It is admirably arranged to develop the correct use of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—James Deman.

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—Martin Kellogg.

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—C. G. L. Wood.

I regard the book about to be published as far superior to any work extant upon that subject.—Wm. S. East, d. M.

I believe the work will be a valuable and much needed addition to our school text-books.—Herman Perry.

You have brought the results of a profound analysis, and made them available, in a practical form.—I. H. Brayton.

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of value as special pleaders and as advocates at the forum.—John Curry.

The subjects upon which you treat have heretofore been too much neglected in the education of young men in America. \* \* \* Exactly calculated to interest. \* \* \* It will soon become a necessity in every lawyer's library.—Charles A. Tuttle.

Its clearness and comprehensiveness make it easy.—G. W. Boate.

ESTABLISHED [MAY, 1860.] VOLUME FIFTEEN

Mining and Scientific Press, COMMENCING JULY, 1867. DEWEY & CO., Publishers.

Issued every SATURDAY, at our Book and Job Printing Office, 505 1/2 Clay street, corner of Sanson, San Francisco. Terms in Advance—One year, \$5; Six months, \$3; Single copies, 15 cents; Monthly rates, \$5.50 per year, or 6 cents per number. Back Volumes from January, 1864, \$3 per volume; bound, \$5 per volume.

DEWEY & CO., Proprietors, Mining and Scientific Press Patent Agency, Newspaper, Book and Job Printing Office, 505 1/2 Clay street, San Francisco.

Blanks, Blank Mining Books, Constitution and By-Laws Mining and Prospecting Companies

Elegantly printed, with care and dispatch, at the office of the Mining and Scientific Press. Orders from the interior faithfully attended to.

To the Legal Voters of the City and County of San Francisco.

Prompted alike by a sense of duty to myself and to the public, and in compliance with the request of several hundred citizens, tax payers and friends of the Public Schools, representing the different political sentiments, religious creeds, nationalities and classes of the San Francisco community, I hereby announce myself an independent Candidate, at the approaching election, for the office of Superintendent of Public Schools. In so doing, I deem it proper to say that I do not thereby appeal from the decision of any party or convention, but simply think it a matter of right, and, under existing circumstances, eminently fit to refer the subject of my candidacy directly to the people, the parties interested; and I think I may properly solicit, and with reason expect, the continued support of the friends of education, and that of all others who think I have faithfully and usefully discharged my duties during the past two years in the office to which I seek a re-election.

I am induced to ask your support, and the more readily comply with the wishes of personal friends and the friends of Public Schools in becoming a candidate, since I am invited to do so "without respect to political considerations, which it is thought should be disregarded in the choice of school officers." Having devoted the best years of my life to the education of the young and to the interests of this city and the State in that connection, I feel that I am justly entitled to the public which I have served. It seems to me that I have discharged my duty as a citizen, and I feel that I am justly entitled to the public which I have served. It seems to me that I have discharged my duty as a citizen, and I feel that I am justly entitled to the public which I have served.

Profoundly thankful for your generous support in a former election, I remain, respectfully, J. C. PELTON, 615-15v

LACOUR'S SARSAPARIPHERE BITTERS

Have so speedily grown in favor that their unrivaled sale has attracted remarks and criticisms of the trade. Jealousy attributes their success to the fineness of their general style, and principally to the originality and beauty of the bottle, which was conceived and manufactured by California artists. MR. LACOUR, an energetic promoter of California resources, desired to show that California has no need of being tributary to other countries for talent or mechanical industry.

The cause of their success is the great benefit they have been to the large number who have already used them. MR. LACOUR is a graduate of the Polytechnic Institute of France, and adds to a thorough knowledge of Chemistry many years of experience; and, after a long and careful experimental study, has been enabled to offer

They are the most efficient Blood Purifier, because they combine with the wholesome Sarsaparilla, which operates by cutaneous excretions, and other substances which gently stimulate the secretions of the lower glands and organs, render digestion easy, obviate costiveness, and remove regularly every impurity of the blood.

They are unrivaled as remedies for Scrofula, Dyspepsia, Constipation, Liver Complaint, Nervous Affections, Colic, Intermittent Fevers, and all diseases arising from impurity of the Blood or Costiveness.

Who Takes Them? The Old Man Takes them as a tonic and mild rejuvenator. The Young Man Takes them to regulate his system, prevent disease, and stimulate to new life his overtasked body.

The Young Woman Takes them to secure regularity in her habits; to tint her cheeks with the bloom of health; to give a sparkle to her eyes, and sweetness to her breath.

The Husband Takes them to promote vitality, give strength to the body, peace to the mind, and with health, wealth and comfort to all his family.

The Wife Takes them to invigorate and strengthen her system, and as an aid to nature in regulating her periodical sickness. Children Take them as a gentle, yet effective tonic. The Drowsy Takes them as a mild, pure stimulant, containing none of the deleterious, essential and luscious of forbidden drinks. The Inebriate Takes them to give tone to his poisoned stomach and allay the fearful longings for strong drink with a stimulant that does not madden or destroy. The Traveler Takes them to prevent sea sickness, and secure his health against change of climate.

Everybody Takes Them! PRO BONO PUBLICO! 2-156m

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

*Miner*, Aug. 10th: Davidson's mill, after running a few days, shut down for repairs. It seems the foundation of the battery was found to be shaky, causing a loss by leakage of too much crushed material to be profitable in the case of ore costing \$100 per ton. The results of the working, with this exception, are entirely satisfactory to the parties concerned. The ore turns out as well and works as close as was anticipated by those under whose counsel the contract was made.

The Mountain Co. made 49 ft. of tunnel last month, and had a regular flood of water to contend with most of the time. McCuen has drawn to his aid a set of hands who will not let up for trifles, who have each imbibed a goodly portion of the indomitable spirit of their leader—a determination to see the old Mountain lode 1,200 ft. below the croppings as soon as powder and muscle will permit.

Some very rich pockets of the decomposed substance bearing the black ore have lately been struck in the Tarshish mine. We were shown a quantity yesterday just as it came out, which would assay at least \$2,000 per ton.

Orders were received by Supt. Ransom, a few days since, to put two shifts on, and push the north drift in the Morning Star lode to the second chimney. Accordingly, four more men are working this week.

The Pennsylvania Co. have elected the old Board of Directors again. The management is in hands capable to open and develop the mine, and determined to see that hope through to its fruition.

No idlers can be found here now; all the old residents are at work, and quite a number of new hands recently arrived have found employment at good wages.

## El Dorado County.

The *Evening Bulletin* of Aug. 5th, says: The average yield of the Shepard mine has been \$25 per ton. Mr. Shepard has obtained at different times from the mine, specimens varying from \$100 to \$500 in value.

A shaft has been run in the Independent claim 400 ft. since the 12th of March. The lead is three ft. wide, and yields \$95 per ton.

The old 10-stamp mill, belonging to the Pacific, has been removed to another locality, and the mine has passed into new hands.

On the bedrock of the Buckeye mine, below the cement, a number of nuggets, of from \$5 to \$75 in value have been found. The owners estimate that it will take 25 years to work out this claim with a 40-stamp mill, or one of Cox's large cement mills.

## Inyo County.

*Virginia Enterprise*, Aug. 9th: The Kearsarge correspondent writes: We were yesterday shown some very fine specimens of ore from Lone Pine. The majority of the specimens are argentiferous galena—such as to wholly destroy the regular galena crystallization. Among other curious mineral specimens was a large piece of asbestos, so pure that it could be twisted into strings. The Mexican miners now in the district manage to make good wages, notwithstanding the scarcity of water.

The mill of the Kearsarge Mining Co. is a first class 10-stamp straight battery, with six Wheeler pans, settlers, etc., complete, enclosed in good spacious buildings, with water close by in abundance.

A lot of ore from the mines of the Silver Sprout Mining Co. was forwarded to San Francisco to test its value, as well as to study and experiment in order to discover the best mode of extracting the metal. We give the result: One experiment of 150 lbs. went \$424.62 silver, \$34.42 gold—total per ton, \$459.04. One experiment of 150 lbs. went \$483.47 silver, \$40.00 gold—total per ton \$523.47. The same ores worked without the application of fire yielded as follows: One experiment of 100 lbs. went \$195.67 silver, \$52.90 gold—total per ton, \$248.57. One experiment of 100 lbs. went \$241.94 silver, \$44.51 gold—total per ton, \$286.45. Two thousand pounds of the same shipment went as follows: Silver, \$507.50; gold, \$62.78; total, \$570. A lot of 75 bags, or about two tons, from the same mines was forwarded to San Francisco, which yielded as follows: Silver, \$776.50; gold, \$70; total, \$846.50.

## Mono County.

*Virginia Enterprise*, Aug. 8th: The Aurora correspondent writes as follows: From several assays made of ore from the lode of Pollux, Rock & Till, it is evident that the vein will pay no less than from \$40 to

\$60 per ton. There has been already located some 4,700 ft. upon the supposed line of the ledge, which can be traced for three miles by the peculiar metallic formation and float rock that is found near Dunderberg Hill.

## Nevada County.

*Gazette*, Aug. 8th: Battis & Co. have recently struck a splendid pay lead 1¾ miles above Washington, on the Yuba. It is supposed to be a continuation of the old Rocky Bar channel. The company are taking out as high as \$12 to the pan.

Aug. 10th: The owners of the Wisconsin ledge are now taking out rock from the 3d level faster than they can get it crushed. The last rock worked at Larimer's mill paid as high as \$81 per ton.

Aug. 14th: The Providence Co. have commenced active operations again, and have been crushing rock for the past 10 days, night and day. They are taking out quartz from the upper level, near the surface, at which point the ledge is about 10 ft. wide. Some of the rock shows a large proportion of sulphurets, and it is in the same chimney of rock that paid over \$20 per ton, three years ago.

The Cornish mill, owned by the Richard Bros., is now in active operation, crushing rock from the Ural ledge. The mill has six stamps, and the rock averages from \$16 to \$25 per ton. The ledge is from two to four ft. wide. Sometimes the gold is nearly all caught in the battery, and then again it is taken almost entirely from the sulphurets.

The owners of the old Wyoming ledge, situated near the Ural, made arrangements some weeks since for the re-opening and working of that mine. About 60 tons of rock has already been taken out, which will yield good pay. We were shown a very rich specimen a day or two ago, containing much free gold and gold bearing sulphurets. A mill was erected on this mine in 1852, when it was worked quite extensively, but it failed to pay at that time, and the mill was removed.

**EXCELSIOR.**—Meadow Lake *Sun*, August 10th: The Excelsior Co. have struck a rich streak of ore on the southeast end of their ledge, at the point where the Green Emigrant runs into their ledge. The ore resembles in appearance that lately worked by the Green Emigrant Co. at the California mill. They have also struck some beautiful looking white quartz in the tunnel which they are running.

The Mohawk & Montreal Co. have struck the ledge of their mine, on the third level, at a depth of 300 ft. from the surface. The tunnel on this level is 40 ft. in length. The rock looks splendid. We never saw finer looking ore than that shown us yesterday by Mr. Chappellette, who took it from the farther end of the above-mentioned tunnel.

The Star Co., Comet ledge, have just levied an assessment of \$1 per foot, preparatory to commencing work on their mine. They have a shaft on their ledge 47 ft. in depth. The ore discovered thus far is of a desulphurized character, and very rich.

We were yesterday shown by Mr. Chappellette 85 ozs. of bullion, valued at upwards of \$1,200, from the Mohawk & Montreal mine. This was obtained from the plates merely, the batteries not have been touched yet. A day or two ago, four tons of tailings from the rock, worked at the Winton mill, concentrated about 65 per cent., and worked at the chlorination works by Wm. Lubbert, yielded \$139.

## Plumas County.

The La Porte correspondent of the *Marysville Appeal*, Aug. 9th, says: The mining is about closed, and our miners seem to be well satisfied with the result, having done exceedingly well.

## Sierra County.

*Downieville Messenger*, Aug. 10th: Excellent prospects have been obtained in a quartz ledge owned by Watson & Co. This ledge formerly paid well, but was lost, and laid idle for several years. They now have a ledge 4 ft. wide, which prospects splendidly.

The Comet Co. have struck it rich, and are taking out fine pay.

S. W. Forbes recently took to San Francisco several hundred pounds of rock from two partially developed ledges—the Good Hope and Eureka—for the purpose of having them tested by some new process recently discovered. Several runs have been made by mills here upon Good Hope rock, and with good results, but not up to what the stockholders think the rock ought to pay.

## Sierraville County.

*Yreka Union*, Aug. 10th: The Portuguese ditch, in Shasta Valley, has lately been sold to Chinamen for \$1,800.

## Tuolumne County.

*Sonoma Herald*, Aug. 10th: Active operations have been resumed on the Confidence

mine, and the cleaning out of the original tunnel is rapidly going on. The highest value of the rock obtained has paid \$30 to the ton. The vein varies from 4 to 14 ft., and its average value is estimated at \$15 to the ton.

## Yuba County.

*Marysville Appeal*, Aug. 6th: Knight & Co., of the assay office, are assaying a large quantity of the precious metals at this time. They have of late been running their crucibles night and day, and yesterday morning completed for shipment 28 large golden bars.

## ALASKA.

[Under this head we propose to give all the information it is possible for us to obtain, concerning minerals in our newly acquired northern Territory of Alaska.]

M. P. Berry, of Salem, Oregon, writes that in 1862 a party of prospectors, on the Stickeen river, 300 miles from its mouth, found gold and silver of great wealth. They worked with hand-rockers eight days, and realized \$13.50 per day in native silver, and \$1,100 in the aggregate in gold. The silver was washed out in pieces sometimes as large as a quarter of a dollar. They also found rubies and agates, and on Bristol river, copper and coal croppings.

The *Portland Herald* stated that C. Gaffney who has just returned from Sitka, reports that coal mines exist in great quantity, and the coal is of extra quality.

A fine article of copper is found in abundance somewhere on the mainland, about 300 miles from Archangel, but the natives have a superstitious idea about it, that has as yet prevented search being made for the mines by the whites.

## ARIZONA.

*Miner*, July 27th: Maj. Coffin, of the Bully Bueno mine, arrived here on the 23d, via Mohave. The Major comes prepared to cancel the indebtedness of the Philadelphia Co. which he represents, and to advance work upon the Bully Bueno and Yahoo mines.

## BRITISH COLUMBIA.

*Cariboo Sentinel*, June 22d: A Squamish Indian showed us yesterday two specimens of gold, which he alleges he obtained from rock about 20 ft. above the level of the sea and contiguous to where the Squamish river debouches into Howe Sound. One specimen consisted of about equal parts of gold and quartz, the value of the gold being, we should say, \$1. The other was pure gold, in that arborescent form in which it not unfrequently exists in the quartz, and had the appearance of having been newly taken from the matrix by the roasting process, and by which the Indian says he obtained it. Its value was, we should judge, about \$1.50.

July 1st: The following is the amount cleaned up by the different mining companies during the past week: Williams' creek—Davis Co., 122 ozs.; Neversweat Co., \$10 per day to the hand; Forest Rose Co., 13 ozs. for one day; Ruby Co., \$2.50 to the pan. Conklin's Gulch—Moonlight, \$1.75 to the pan; Ericsson, 46 ozs.; United, 18 ozs.; Reed, 46½ ozs.; Indian Queen, \$20 per day to the hand. Stout's Gulch—Alturas, 132 ozs. in three days; Mucho Oro, 40 ozs.

In Black Jack Gulch, the Annie Walker Co. cleaned up \$400 for the week ending 23d June.

July 8th: The Wilson Co., at Williams' creek, cleaned up for the last week \$1,060. The Tennessee Co., for the same length of time, cleaned up 50 ozs., being the result of the labor of two men. The Six-Toed Pete Co. cleaned up for the week 30 ozs.; Davis Co., 110 ozs.; Aurora Co., 45 ozs.; Borealis Co., 47 ozs.; Forest Rose Co., 45 ozs.; and Ruby Co., 40 ozs.

In Conking's Gulch, the Alturas Co. cleaned up for the week 184 ozs.; Jenkins Co., 40 ozs.; Mucho Oro Co., 20 ozs.; U. S. Co., 105 ozs.; Ried Co., 20 ozs. Indian Queen Co. are making from \$10 to \$12 per day to the hand.

At Nelson's creek, there are 25 men, making from \$7 per day upwards.

On Hixou creek, there are 12 men at work on the Washburno quartz lode, and some 11 or 12 white men are working surface diggings, making from \$8 to \$9 per day. Before our informant left, two Indians camp, bringing several large pieces of gold, which they stated had been picked up by them at a place some 60 or 80 miles from Cañon creek, on the western side of the Fraser. As the Indians are well known to Messrs. Pollock and Geddon, of Hixon creek, these gentlemen are about to form a party to accompany them to the locality.

The Cherry Creek Co. have had three samples of ore assayed at the Government Assay office here, and the result is as follows: Specimen No. 1, taken from the black ore lead, gives 1,591 ozs. of silver and 6

dws. of gold to the ton. Specimen No. 2, taken from the hillside, gives 1,259 ozs. of silver, with traces of gold. Specimen No. 3, from McWorthy's tunnel, gives 163 ozs. of silver, with traces of gold.

July 11th: Some what of an excitement was felt yesterday in consequence of the prospects obtained by the Moonlight Co., in Conklin's Gulch. They were reported to have washed out \$21 in three buckets of dirt. The Indian Queen Co., immediately below them, got as high as \$18 to the pan.

The Ruby Co. found a piece of gold last Tuesday which weighed \$90.

## COLORADO.

*Georgetown Miner*, July 18th: The Silver Cloud lode, although not opened to any great depth, has a vein of solid ore four ft. in width bearing sulphurets of silver, silver glance and some show of chloride of the same metal. One wall rock has been disclosed, having a true perpendicular bearing, and a surface as smooth as a plank.

July 25th: The Georgetown Silver Smelting Co. took out last week \$800 worth of bullion. A vein of the finest argentiferous galena 2½ ft. wide, has been disclosed in the Boston lode. Blocks of pure ore weighing 300 lbs., have been hoisted from the mine.

The Little Giant smelting furnace was started up on galena ore last Monday morning, for the purpose of filling the hearth.

The tunnel on the Herring lode is now in 370 ft., and the shaft on the lode is now 170 ft. in depth. The shaft will strike the tunnel at a depth of 450 ft., at a distance of 900 ft. from the tunnel. It has already crossed many lodes, but their value are not yet ascertained.

The Muscovite lode has been sold for \$15,000. The lode presents the largest mass of pure argentiferous galena of any lode in the country.

Thos. H. Sweeney, of Georgetown, and Capt. Eugene Gausson, of Baltimore, Maryland, have purchased the Mountain Chief lode, in Idaho Dist., for \$10,000, payable six months from date.

Specimens of ore from the New Philadelphia lode look very promising. The lode is constantly increasing in size and quality.

Martine's works are running on Nuckolls ore.

At South Boulder, Horton, Frothingham and Jones are mining the Oro Cach lode, and are taking out ores which prospect very richly. As soon as their new machinery arrives, they will commence running their mill.

Col. Graflin is running his mill on the ores of the Porigo lode with satisfactory results. L. A. Wait is engaged in mining just below the Rollins sawmill, on the bars of the Boulder. He is employing a large force and is making it pay.

Prospecting is now being extensively carried on in Downieville, Montana, Morris, Bunner and Iowa Dists., and we hear of many valuable lodes being opened up. Lodes are being rapidly developed, and rich ore is being piled up, waiting for works to reduce it.

The shaft on the Hunkadora lode was 20 ft. deep at the close of last week. Very superior looking stuff was then being taken out of the mine.

Fred Clark deposited in our office the other day a big chunk of ore from the Terrible lode that attracts much attention on account of its size, weight and purity. It is zinc, carrying \$200 in silver to the ton, and the lode produced it in large and inexhaustible quantities.

The parties who bonded the Nuckolls lode, allowed the bond to become forfeit, alleging as a reason that they could buy all the lodes they desired for a thousand apiece.

At James Creek, Behee's mill is running ores from the Indian Jack and Potosi lodes, with good results. The bedrock has been struck in the gulch where Cobb, Clough, Fry and Hopkins are mining, and a fine clean up will soon be made. Messrs. Cobb, Fry & Co. are building a 14-stamp mill to run on quartz from the Potosi lode. From the prospects of top dirt, it is thought that about \$300 to the cord will be obtained. Mr. Stanley is taking out \$100 to the cord of ore, with an arastra. Water is rather low, but a ditch is being constructed which will bring the water from St. Vrains, and furnish enough for gulching and arastras along James Creek.

We saw this morning, in the office of Byers & Schirmer, a very fine prospect of free gold, from ores from the Hattie Jane, Yosemite, Free Gold and Solux Tyeec lodes in Granite Dist. Prof. Schirmer informed us that the average yield per lode, from panning and washing six ozs. of quartz from each was \$1,043.94. An assay by the Professor yielded as follows: Solux Tyeec lode, \$1,212.94 per ton; Free Gold lode, \$1,316.74 per ton; Hattie Jane and Yosemite lodes each, \$1,307.35 per ton.

## IDAHO.

World, July 26th: With reference to the new gold ledge lately discovered near Placerville, Mr. Britten says that he examined the ledge, washed up some of the rock himself, and exhibited to us the product. From two shovelfull of the rotten rock he got out over \$2½ of very fine gold. The ledge is uncovered and has been tested a length of 700 ft. It is from two to three ft. wide, and all along, in every spot, yields about the same wonderful product of gold. So far it has averaged between \$2.50 and \$5 to the pan. The rock crumbles like so much loose earth in water, and is very easily worked. The washings from it have so far paid \$150 to the hand.

July 31st: A specimen of ore of two or three lbs. weight from the Banner ledge brought for our inspection by Mr. Carr, presents a very good appearance as richly paying rock, and we are assured that it is a fair average specimen of the ore found in the shaft last sunk, 52 ft. deep, from which about 50 tons of rock have been taken. This will be crushed in the course of a few weeks, when Cromwell's arastras will be completed.

Gold Hill is now a flourishing camp, and all the miners there, and as far as Beaver Creek, four miles this side of Gold Hill, are making from good to extravagant wages. Indeed, the lowest estimate of daily yield was a product of \$10 per day to the hand, and one or two claims have paid as high as \$100 per day. There are at work about Gold Hill and Beaver Creek, fully 200 miners, nearly equally divided between the two camps.

Lewiston Journal, July 25th: The editor writing from Warron's camp, July 21st, says Capt. Williams has sent an order by this express to San Francisco for a 5-stamp quartz mill, to be propelled by water power. He will roast the ore before crushing, also roast in a furnace after crushing. He expects to have the machinery here and in operation this fall. The Miner's Mill Co. are active, and will order their machinery in about 10 days. Money is being paid on the installments, and it is believed that sufficient will be received within that time to purchase the machinery. A new gold lead has been found on the divide near Hall's Gulch. The rock is very rich. The arastra has been compelled to cease work for want of water to drive the machinery. They have crushed some of the *Hic Jacet* ore, but have not yet cleaned up. Every indication in the arastra, warrants the belief that the yield will be very large, so much so as to astonish the unbelieving. It is a shame that a good mill is not now in operation here. If it were so, hundreds of thousands of dollars could be taken out of the ore of this camp before spring. Capitalists are blind respecting this camp, else they would be over-zealous to make investments here. Miller's camp is doing well. The claims are averaging \$14 per day to the hand. Also Rise's Camp is prospecting well. Much hydraulic has been done on the high benches, and as yet no bedrock is reached, though all the gravel prospects well. There is much coarse gold. Preparations are being made to build a mill in Flint Dist.

Many of the claims at Lemhi have proved valueless and been abandoned, but others have been found to pay. New discoveries have been made on a creek 30 miles this side of Hylus Creek, and good prospects obtained. Some 600 men are at work on the creek, making extensive arrangements for mining.

Owyhee *Avalanche*, Aug. 3d: The Oro Fino ledge is proving its worth. It has a 5-ft. ledge, and of a quality as rich as ever was produced from the mine.

The machinery of the Iowa and Idaho Co's mill has arrived in Flint, and will be put in place right away. The Forrest ledge is looking better than ever before. The main shaft is down 80 ft., and the vein has increased to a width of seven ft.

The Black mill is running on Leviathan rock and is doing better than heretofore.

Dalles *Mountaineer*, Aug. 3d: We were shown a piece of silver bearing quartz at Bloch, Miller & Co's store, that came from the Flint Dist. in the Owyhee country, a portion of which was assayed by Mr. Chas. Miller, and found to contain \$2,000 worth of silver to the ton. The lode is very large and extensive and bids fair to compete with the richest mines in the country.

## MONTANA.

Post, July 27th: From Prof. Steitz we learn that all of the machinery for the works of the St. Louis & Montana Mining Co. at Flint Creek, has reached the ground, and it is expected to have the mill in running order by the 1st of October.

A very rich gold bearing quartz ledge has been discovered lately at the head of Deadwood Gulch, near Uncle Bee's. To judge from the specimens exhibited, it must be extraordinarily rich indeed.

J. D. Hinnton, of Elk Gulch, brought in with him one of the purest nuggets we have ever seen. It weighs 11½ ozs., and is entirely free from quartz. It was taken out of the claims of Donahue & Co. in Elk Creek, and is the largest ever taken out of the gulch.

Mr. H. N. Maguire is the discoverer of a new gulch, which prospects very well. The average prospects are 10 cts., but as high as \$1 has been obtained.

The Union City (Christenot) Mills Co. have located their grand tunnel through Grant Hill, and are now working it at both the Spring Gulch and Summit ends. The eastern tunnel is already in 160 ft., and is being pushed night and day. The length of the tunnel will be 2,116 ft., and it will tap the Grant at a depth of 380 ft. The company proposes to rely entirely upon their tunnel for a supply of ore, and abandon their shafts on the Oro Cache. They have had 60 ft. of a hard cap on the Oro Cache discovery, and are not through it yet, and in the shaft on No. 2 Oro Cache, water is very troublesome at 115 ft. The Chilean wheels of the mills have been filled with litharge and 2,500 lbs. added to the general weight of each. The whole mills have been changed from wet to dry crushing, so successfully tried two weeks ago, and on Monday the whole will be started. They will crush from 12 to 15 tons every 12 hours, and their barrel amalgamators can master any sulphurets ever yet tried on them from the Montana mines.

Lewiston Journal, July 25th: Forty quartz mills are reported as now being on the route to Montana.

## NEVADA.

## Black Rock.

Chico Courier, Aug. 3d: W. H. Dureu and Prof. Isenbeck arrived in town last evening, from Black Rock. They bring most flattering reports from the richness of the country. Some 30 or 40 tons of ore, in all, have gone to Virginia City for working, and Isenbeck left on the stage to-day for Virginia to assist in the working. Dureu brings many fine specimens and curiosities, a portion of which are intended for our cabinet. The Virginia City men have the utmost confidence in Black Rock, and the millmen have never failed to get rich working tests.

## Esmeralda.

Enterprise, Aug. 8th: In Silver Peak Dist., J. M. Harris in connection with the development of the mine for which he is agent, is taking out a large stock of rock, ahead of the erection of their new mill. The Red Mountain vein is the most important lode owned by the company. The ledge is not less than 40 ft. thick. Gold is the predominating metal. The entire body of ore now developed will mill \$50 per ton.

A company is engaged in erecting a five-stamp mill at Aurora. The largest part of the machinery has been delivered on the ground. The company own the Baluarte mine. This mine is represented to be of great size, and exhibits an abundance of mineral of a high grade, with which the mill can easily be supplied. The new mineral, which has been named steterfeldite in honor of the discoverer, and which occurs so extensively in the districts lying to the southeast, appears to be the chief bearer of silver in the Columbus Dist. It occurs in all the ledges which have been developed to any extent. Extra specimens of it are produced by the Northern Belle—an Amazonian beauty, 23 ft. thick—one of the ledges owned by Alsop J. Holmes & Co. We were shown by Mr. Holmes the certificate of an assay by David Lundbom of a sample of the ore from that ledge, which yielded at the rate of \$4,619.93 of silver to the ton.

## Pahranaugat.

Reveille, Aug. 10th: Mr. Fleming, lately from Pahranaugat, brought in 60 lbs. of crude bullion, which were produced from ore of the List ledge belonging to the company. This ledge is being developed by a shaft and drifts, and a good quality of ore extracted, of which he brought a variety of samples. He brought also fine specimens of rock salt from Salt Mountain, situated about 75 miles southeast of the district. The salt is thrown out by blasting, and is obtained in great cubes resembling the finest quality of glass. It does not absorb moisture by long exposure, and is believed to be chemically pure. The Alameda Co. is now likely to reap the benefit of experience and skill, as its agent has had the advantage of several years connection with mines in Mexico, and subsequently with milling in Aurora.

## Reese River.

Reveille, Aug. 2d: The gold mines of New Pass Dist. are now being developed by a company under favorable circumstances. The veins occur under the happiest conditions. They are found only in greenstone, which in most other localities where gold

quartz exists changes to a chloritic slate. The greenstone occurs in small isolated patches in the country rock, which is porphyry and limestone.

A lot of ore from the Superior ledge from which all the choicest pieces had been selected for specimens, gave an average yield by assay of \$32 per ton.

Various tests of ore from the small veins comprising the gold belt series, invariably exceeded \$100 gold per ton.

During the last week a better quality of ore has been developed in the Savannah mine, while that vein preserves its large size. A fine large specimen of its sulphuret ore was shown to us this morning, the entire surface of which was covered with ruby. The specimen was taken from the lower level, which is 100 ft. below the surface.

Aug. 6th: The Florida mine belonging to the New York and Austin Co., is opened by a shaft 350 ft. deep. Three levels are being run at present. The average width of the vein is 16 in.; no ore has yet been extracted. The extent of levels and incline run, makes in the aggregate 50,000 cubic ft., or a fraction over 4,000 tons of ore. The number of tons of ore taken from the mine is 317, 28 tons of which are not yet crushed. Of this amount, 289 tons produced \$74,823.82, or an average of \$259 per ton. The cost of producing, including office expenses, taxes, etc., \$65,740.21; this leaves a net profit of \$9,083.61, with avenues through the mine, of the value of not less than \$15,000, besides property of the value of \$5,000 more. The foregoing statements cover the operations for the 10 months ending June 30th. Since then new and powerful machinery has been placed on the mine at the cost of \$10,000, while \$5,000 worth of ore has been taken out of the mine and hauled to the mill for crushing.

The editor has been shown several samples of ore from the Diana mine, which were different and of a better quality than that heretofore produced. The samples exhibited both ruby and native silver, and were taken from the eastern level.

The following is the result of an assay by David Lundbom, of ore and pulp from ledges in Union Dist. Ore from the Gold Leaf yielded \$236.90 silver and \$2,097.39 gold; from the Fralinda, \$108.39 silver and \$12.50 gold. A sample of the pulp from the Beta ore gave at the rate of \$71.47 silver and \$90.31 gold. All the ledges are situated in the town of Union.

Aug. 7th: The Murphy mine, in Ophir Cañon, is sending forth bullion in quantities sufficient to make healthy bank accounts for its owners.

More work has been done on the Highridge ledge than on any other in the State outside of the Comstock. But one 10-stamp mill is at work as yet. They work without roasting their ores, and are getting about 50 or 60 per cent. of their metal from their ores. They are saving tailings, and expect fine results from working the same. The Combination Co., of New York city, have their mine in fine shape. It is ready for their 40-stamp mill, which is now rapidly building.

The Union mill, from Austin, is being removed, and they are now rebuilding it on Hot creek, near the much talked of Indian Jim ledge.

Aug. 10th: The following letter has been received by Wm. F. Gorman from a friend in the South Pass mines: "The mines are a bilk. I have prospected them until I am sick, and now I am on the road, fighting Indians. Only one quartz ledge was found in this section, and about 100 extensions were located on it. The gulch diggings are of no account, and will not pay to work."

Winters & Co. have made another strike in the Juniata mine. The shaft has been run into the ledge 14 ft. without crossing it. At this point rock was taken out showing coarse gold and native silver in abundance.

## Washoe.

Gold Hill News, Aug. 5th: The Virginia Water Co. have bought the Eagle mill in Silver City, and are about preparing the cañon there, by dam and otherwise, for an immense reservoir, to save tailings.

Aug. 8th: The owners of the Bacon mill recently sunk a 30-ft. shaft, and are running a drift east for a water supply. They have struck a considerable flow of water already, but are still pressing on.

Enterprise, Aug. 8th: Mr. J. C. Clark has just added four new Greeley pans and two 8-ft. settlers to the Hoosier State mill. When complete, the mill will have eight Greeley pans, six Knox pans, four settlers, three agitators and eighteen stamps, with a capacity for crushing 40 tons per day.

The Crown Point mine have a body of rich ore 10 ft. in thickness, which will yield

\$70 per ton, with a fair prospect of its increasing to even greater width. The ore is of a very superior quality. The north shaft of the Yellow Jacket Co., in an east drift, have found the same stratum. It is very rich, and proves very extensive.

The sulphuret sayer of Paine & Stevens, below the Gould & Curry mill, is doing good work.

Aug. 10th: Next week the pumps will be started in the Sierra Nevada mine.

During the past week, Wells, Fargo & Co. have shipped 7,596 lbs. of crude bullion, valued at \$216,887.15.

Trespass, Aug. 10th: The Eclipse mill is undergoing repairs.

## NEW MEXICO.

Albuquerque Press, June 22d: There are now in the Pinos Altos mines nearly 1,200 miners, and the number is continually increased by arrivals from Arizona, California, Colorado and Texas. The Pinos Altos Mining Co. has commenced work with their new quartz mill, and the result has exceeded their most sanguine expectations. One of the firm refused \$25,000 for his interest in the lode.

## OREGON.

Dalles *Mountaineer*, Aug. 3d: Mr. F. N. Dodge on yesterday afternoon, presented us with a beautiful specimen of gold quartz that was taken from the newly discovered ledge near Cañon City. He assures us there is no humbug in relation to the discovery of the lode.

Rich prospects are said to have been struck, on Queen's river, on the south side of Stein's mountain.

The Salem Record says that the Santiam mines are to be fully tested this summer by the intelligent labor of experienced miners from Washoe. The company consists of two brothers named Salmon and another, all three being practical miners and millmen. Mr. Salmon is a thorough and scientific amalgamator. The party have visited the mine and mill, and formed their opinion, and the Union Co. has granted them the privilege of using the mill to test the mines and offer them the ore in the mill—about 70 tons—to experiment upon; the company to be at no expense for the working, and to have no claim upon the proceeds. By this means the mines will soon be thoroughly tested by experienced men; and if the prospect proves favorable, an arrangement can be made with them to keep the mill in operation. Mr. Salmon found the mill in excellent order, and says it is a first class mill for its size—as good a mill as he ever saw. It is the opinion of this gentleman that the pulp has been worked too much so as to destroy the effect of quicksilver; he thinks the gold can be saved with less effort than has been used.

The Albany Democrat says that rich diggings have been struck near Houly's Ranch, Soda Springs, at the foot of the Cascade Mountains.

The Jacksonville Press says: The Malachi ledge, on Cañon Creek, opposite Kirbyville, is turning out gloriously. Mr. Malachi hauled 3,600 lbs. of what he considered the poorest rock, to Cohn's mill, for crushing, from which he realized eight ozs., and \$10. He said before testing it, that if that rock paid, "he was all right," as he had an abundance of rock of a much better quality.

## UTAH.

Salt Lake Vedette, July 30th: According to the statements of all those with whom we have talked, the existence of numerous gold bearing quartz ledges on the north side of the Sweetwater, is a demonstrated fact. The discovery claims of Lewis Robinson, Terry, and that company, are exceedingly rich, so far as developed. With ordinary hand mortars, selected rock was being pounded out at a yield of \$25 to \$40 per day to the mortar, and even as high as \$100. The existence of placer diggings had not been discovered to any great extent; some two or three gulches only. Little prospecting for placers had been done. In coming out from the mines some parties crossed through the country where the Sandys rise, which had all the appearance of a wash country; and looked as though it would bear prospecting. Not having their mining implements along, and the danger from an Indian attack, prevented the parties from prospecting that locality. It is said that across the ridge in the Wind River country, surface indications are good. There are no miners or prospectors in there now. The Indians command the situation. We have seen a great many specimens of the quartz rock, and they are exceedingly rich in gold. Parties also found silver quartz and copper veins in the same range. The course of the ledges is north-east and south-west, and look to be well defined.

Rock from the Sweetwater lately assayed \$75.24 gold, and \$1.56 silver per ton.

## Mining and Scientific Press.

Writers should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. Alfred H. Nabor, is our duly authorized traveling agent for Amador and El Dorado counties July 28.

Mr. W. D. Root is an authorized agent for this paper for Nevada State. August 1, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

## San Francisco:

Saturday Morning, Aug. 17, 1867.

## Notices to Correspondents.

BRETON.—Female artists are by no means so rare as you imagine, if the question is viewed historically. Your countrywoman, Rosa Bonheur, deservedly merits the high reputation which she has obtained; notwithstanding which statement we cannot concede that she outvies all other artistic ladies, unless the remark is confined to her contemporaries only. At a very early date, Kora, a daughter of Dihnades, a native of Corinth, is said to have taken the lead. At the time of Alexander the Great, Ciceret, Aristerite and Calypso were noted female artists. In Roman annals, Laya, of Greek descent, who lived 100 years before Christ, had a high reputation for painting. Amongst the nuns during the middle ages art was much cultivated, their time being largely employed in illuminating and copying manuscripts and missals. Margartha von Eck, sister to Hubert von Eck, assisted the latter in forming the celebrated ornamental breviary now in the Imperial Library of Paris, which was made for the Duke of Bedford, who married the sister of Peter the Good in 1423. Many other celebrated artists, both of ancient and modern times, might be enumerated.

ASTEROID.—On the probable occurrence of a brilliant meteoric shower in the course of the current fall, we do not consider our astronomical acquirements justify us in passing any opinion, in place of which we respectfully submit some general views recently published by one of the illustrious inductive discoverers of the planet Neptune. Prof. Adams has determined by elaborate calculation that the periodic time of the November meteors is 33.25 years. In a communication to the Royal Astronomical Society he remarks: "It appears probable that the great comet of 1862 is a part of the same current of matter as that to which the August meteors belong."

SCORUS.—Thomas Babington Macaulay, the historian, who was eventually ennobled under the title of Baron Macaulay of Rothby, was a native of England, his parents having been a Highland sire (Zacharias Macaulay), and an English mother (a British Quakeress). The parenthetical words have been so inserted because, singular to remark, his most pungent sarcasms have been pointed against Highlanders and Quakers. He has not unwaptly been described as the libeler of William Penn and the lampooner of the Highlands, and there can be no doubt with any candid reader, that the former is unfair, and the latter greatly exaggerated. By some one it has been said that it is difficult to distinguish which he has most abused, those who have given birth to his father or his mother. It is a received axiom, that no quarrel is so bitter as a family one, and it not uncommonly happens that the son on matters of opinion, forms a complete contrast with the sire. Such was the case with the son of our Benjamin Franklin, and the William Penn above alluded to.

## The Grain Crop of California.

The fact is now pretty well established that the California grain crop, for the present year, will fully equal, if not exceed that of the year just passed. True, there are some who set down the yield for 1867 at a figure largely below that of 1866; but there are others, equally well informed, who estimate it as high as 50 per cent. greater. The truth probably lies in a mean between the two. It may safely be set down as equal to the last year's yield. The farmers of California will soon add another ten millions to the net wealth of the State.

It is interesting, in this connection, to look at one of the incidental results of an excess of grain shipments. By referring to the bullion shipments of March, April and May last—the months on which the largest amounts of grain were shipped—it will be observed that the shipments of the precious metals fell off as that of grain increased; while subsequently, when grain shipments began to fall off, the efflux of bullion was increased to its former rates. It will be observed, moreover, that the bullion shipments decreased at the very time when the largest amount was being taken out from the mines, and increased as the dry season approached, when the yield of the precious metals decreased. A careful estimate of the gold shipments for the harvest year of 1866, will show a falling off very nearly equal to the amount of grain shipments for the same time. This fact shows that it requires nearly all the gold and silver we can get out to pay our Eastern debts; and that when our farmers are able to spare a surplus from their crops for shipment, it takes the place of just so much gold—saving the latter for accumulation or investment at home.

Agriculture is ever the real basis of prosperity the world over; and facts on this coast show that even the richest mineral State on the globe is no exception to the general rule. Gold is the basis of speculation, which is ever uncertain and ephemeral—labor, especially as brought to bear in tilling the soil, is that which builds up the State.

The people of California are just beginning to realize the unbonded agricultural resources of the State. The past year has shown us that wheat can be profitably raised here, even as low as \$1.50 per bushel. At that price it will always pay for shipment to Europe, and often to the Eastern States; while \$1.60 to \$1.80 can most generally be depended on. The shipments of grain from this State will hereafter be limited only by the amount of tonnage to take it away. At present prices, ships to China and Japan can make it profitable to cross the Pacific in ballast and load for home with grain in San Francisco. This is certainly a most noticeable and encouraging feature in the history of commercial matters on this coast—San Francisco offering a market for freights so much better than China, as to make it an object to come hither in ballast to find a freight home!

If our merchants would retain this important advantage, however, they must look a little closer to our port charges. The San Francisco correspondent of the Sacramento *Union*, writing under date of July 25th, tells us that pilotage is as high in this port as it was in 1849! and that the total port charges against a ship coming into San Francisco is \$10 a ton of her measurement! In conversation, a few days since, with Captain Luce, of the ship *Saurise*, who has visited this port several times, we were assured that his wharf charges here were \$800 in gold, while for the same time, and with no better accommodation, in New York, they would not exceed \$160! This would appear to be had policy, especially when the city holds the wharves for the benefit of the State at large. If California expects to retain the advantages which she now possesses, and reap the full benefit of her mines and crops, she must make the

expenses of ships visiting this port, to take away our productions, as low as possible.

It is but proper, however, that in this connection we should allude to the fact that the city is at this time under the necessity of raising a large revenue from the wharf property for the purpose of building a sea wall for the protection of the harbor and city front. As soon as this work is completed, a very material modification will no doubt be made in the matter of wharfage.

It should also be mentioned that the excess of wharfage at this port over that of New York and other Eastern ports is more apparent than real. This fact grows out of the difference in the manner of collecting the wharfage. At the East, this charge is divided between the ship and the goods; here, for convenience and economy of collection, it is all assessed directly upon the ship, which should make good the addition by an increased freight tariff.

Again, the Wharf Commissioners make a distinction in wharfage between loading and unloading—the former being half the cost of the latter. Thus an important discrimination is made in favor of the ship while taking on board the products of our mines or soil for shipment abroad. As already hinted, the wharf charges here will be reduced as soon as the improvements now in progress are completed. With regard to the port charges and pilotage, we are not particularly informed. If what the correspondent of the *Union* states is true, it certainly appears as though a modification in those charges ought to be made. It is for the interest of both the city and the State to make such charges as low as possible. In no other way can we so effectually encourage the cultivation of our soil and the development of our extensive and valuable mines of copper and useful minerals, other than those producing the precious metals.

During the recent exceedingly high prices of copper and grain, ship-owners could perhaps afford to pay high costs; but copper is now down, and our shipments of that product have almost ceased. Grain is also lower than it was a year ago, and the profits to be realized will not admit of the high freights hitherto obtained. Let our merchants see to it that, as freights are unavoidably declining, no unnecessary tax is put upon shipping to keep it away from this port. If California expects to reap the full advantages of her mines and crops, she must offer inducements to shipowners to come hither and take her products to market, rather than lay upon them burdens which they meet with nowhere else. Our abundant grain harvest, the large and increasing wool clip, the production of coal, copper and other ores, coupled with our extensive lumber interests, are reservoirs of freight supplies that are almost inexhaustible, promising remunerative freights in all future time. We have also resident agents for the Guano Islands of the Pacific, for vessels to fall back upon in case of an emergency.

THE GREAT REPUBLIC.—This splendid steamer, which made the passage from New York to this port in 75 days, including her stoppage of one week at Pauama, will start on her first trip for China on the 3d of September. She is one of the largest and finest steamships afloat. Her length is 375 feet; beam 50 feet; depth 31½ feet. Tonnage, by government measurement, 3,882; carpenter's measurement, 5,000; cargo capacity, 2,000 tons. She can accommodate over 1,000 passengers, having the best of cabin accommodations for 230. All her appointments, including armament, and particularly her fire extinguishing apparatus, are most ample and complete. She is commended and admired by many thousands of our citizens since her arrival at this port.

The number of sea-going vessels in the world is about 85,000, of which two-thirds belong to England and the United States.

## A New Explosive Compound.

A large number of capitalists, contractors and others interested in the use of explosive agents, were present on the line of the railroad near Bay View Park, on Saturday last, to witness the trial of a new preparation of this description. There were some fifteen charges exploded, varying in the diameter and depth of bore and quantity of preparation, and in each instance the result was proportioned, to the variation in the particulars mentioned. The manner of preparing the charge is very simple. It is enclosed in a paper, similar to that used for cartridges, and coiled as we see india rubber hose done up, the diameter varying according to necessities or convenience of work. When the bore is prepared, the operator cuts off a piece of cartridge sufficient for its depth; next, he takes a piece of metal resembling a cannon percussion cap, which he fastens with a pair of nippers closely around one end of the fuse to be used; next, the cap is punctured with a small hard-awl, and is then inserted in one end of the charge, which, being thus prepared, is placed in position. Nothing more is required than to fire the fuse to produce a result that surprises all who witness the effect and are familiar with the process of blasting. The name of the composition and ingredients are secrets, known only to the inventor and those associated with him. A company is being organized to manufacture the article on a large scale in this city. It is said that a saving of fifty per cent. on the cost of blasting hard rock can be saved by the use of this material over the expense of the same work by the aid of the ordinary blasting powder.

At a previous exhibition of this preparation, which has the appearance of a coarse grained powder, in color and size resembling sawdust, the operator drilled holes, an inch deep and half an inch in diameter, in hard trap rock, and all the varieties of rock to be obtained in the Deep Cut. These holes were filled without the use of tamping, a small piece of fuse being employed. One or two little holes, as above described, contained sufficient of this fearful explosive to produce a most extraordinary effect on the hardest rock. A very little, laid on an inch board, was exploded, splitting the board in every direction and blowing a hole in it as large as a man's hand.

GOING EAST.—Mr. A. T. Dewey, one of the proprietors of this journal, starts for the East by the steamer of Monday, partly on business, and in part on a visit to the "old folks at home." He will be absent several months, and will visit the principal Eastern cities in the way of business. Persons in New York, Boston, Philadelphia or Washington, wishing to communicate with him on business or other purposes, will please address him at Westfield, Mass. Any persons who may desire a personal interview, in either of the cities mentioned, can secure the same by forwarding their address to him as above, immediately on receipt of this writing. Mr. Dewey will spend some considerable time in Washington, looking after the numerous patent cases in our hands, many of which, in consequence of the present embarrassed condition of things in the Patent Office, have been subject to great and annoying delays. Everything possible will be done to secure for our clients the earliest and most prompt action at that office. We commend Mr. Dewey to the good offices of our editorial brethren at the East.

NEW BOILER WORKS.—Messrs. Baurhyte & McAfee—two practical boiler-makers—have just opened in a large new building on Howard street, between Fremont and Beale, where they will be happy to see their friends. By reference to their card, it will be seen that they have had many years of experience in the business, and feel confident of being able to give good satisfaction to any that give them a trial.

Cyanide of Potassium.

This chemical, which has been heretofore chiefly used in electrotyping, gilding, and in photography, is now being quite extensively employed in the amalgamating room, for gold saving. Its use for the former purposes very naturally suggested its employment for the latter. It is claimed by many who have used it to be more economical and a better gold collector than sodium amalgam, or any other article ever employed for similar purposes. Its action in the quartz mill is not yet very fully understood; but it is the soul of the various secret processes employed by such parties as are in the habit of throwing much mystery about their manipulations in the amalgamating room. Cyanide, like sodium, attacks and decomposes the oxides of many of the metals; and there is no doubt that to this property is due its value in milling. A thin coating of oxide will prevent the action of mercury upon the metals. This coating is readily removed by the cyanide, so that the desired amalgamation may take place.

The cyanide of potassium was first employed at Pike's Peak, and with such satisfactory results that its advantages soon became known on this coast. It is used both on copper plates and in the batteries or pans. The directions to amalgamate and sensitize the plates are given as follows: First clean the plates with sand and nitric acid until they are quite bright; then wash them off with an abundance of cold water; then with a rag, or swab, or piece of sponge, tied to a whalebone or stick, wet the surface of the plates quickly and thoroughly with a solution of cyanide, apply mercury immediately, and rub it on well; the plates will thereby become coated, presenting a highly sensitive coating of mercury, which will seize upon the gold as it passes over them. The cyanide solution may be applied with great advantage to the battery; a portion to be added as often as the mercury is supplied. Experiments should be made, as different rocks will require greater or less quantity, as may be found by trial. The experience of the best millmen shows that the article may be used with mercury in all milling operations to great advantage. This chemical is largely manufactured by Messrs. Falkenau & Hanks, at the Pacific Chemical Works, at the Mission and in this city, and sold at their place of business, 623 Montgomery street.

**PATTINSON'S WATER WHEEL.**—In our issue of the 3d inst., we noticed the issue of a patent to Thomas Pattinson, of Little York, for a water wheel, as there described. This wheel is the origin of the class known as "hurdy-gurdy wheels," now so generally used by cement mills in and about Little York, You Bet, etc. The first wheel of this description was put up by the inventor, about two years since, at the Buckman & Curran mill in Little York. At this time, so popular has it become, owing to its simplicity and economy, it is estimated that not less than 200 are at work in different parts of the State; orders for their construction, some with more or less modification, having been received all the way from Shasta to the lower portion of the State. They are especially adapted to places where it is desirable to use a high head with a small volume of water—250 feet head and 30 or 35 inches of water will drive a 10-stamp mill, with 900 pound stamps. Of course the higher the head, the less the volume of water required. The construction of this wheel is exceedingly simple, and it can be built for from \$150 to \$500, according to the manner of construction and size of wheel. Applications for this wheel should be made to the inventor and patentee, Thomas Pattinson, Little York. See his advertisement in another column.

**VICTORIA** is to have a dry dock. The admiral in command has received orders to that effect. Work will be commenced at an early day.

Office Pacific Business College and Telegraphic Institute. 7v15-Sun  
Mechanics' Institute Building, Post Street. [Exterior View.]

**CANE PRESENTATION.**—We copy from the *Times* of yesterday morning, the following account of a very interesting little incident that occurred in this office on Thursday evening:

Mr. A. T. Dewey, one of the publishers of the *MINING AND SCIENTIFIC PRESS* was presented, by the attachés of the office, with a handsome gold-mounted cane. The presentation was made by one of the assistant editors, Mr. John L. Boone, who expressed himself as follows on the occasion:

"Mr. Dewey—Owing to the near approach of the time when you intend to absent yourself from us for a term of months, the attachés of the *MINING AND SCIENTIFIC PRESS* have concluded to present to you some token of their good will, to be carried with you, and to remind you while you are East, of the kindly wishes that follow you, and to this end they have purchased a cane. The material with which it is mounted is especially indicative of your profession, while the entire material and manufacture is the production of this, our adopted State. And if at any time during your absence a doubt should arise in your mind, as to the conduct of your business affairs in this place, we hope that a sight of this gift will dispel them, and remind you of the kindly wishes that follow you. We did not purchase a cane because you needed a support, or because age required it, but as a symbol of that support which we expect to extend to you during your absence; and while we all regret the parting, we send a God speed and happy journey along with you. So take the cane, and we only hope that it is as much a pleasure for you to receive, as it is for us to give. And now, on behalf of the attachés of this office, allow me to say,

"The kindest wishes of thy friends  
Go with thee 'till thy journey ends."

The recipient was at first taken by surprise, for the gift was unexpected; but he recovered himself immediately, and in a few words thanked the donors, and assured them that he should value the present highly. The cane was manufactured by Messrs. Barrett & Sherwood, and is in their best style. Mr. Dewey will go East by the steamer of the 19th, and be absent several months.

**A SELF-CORING MORTISING CHISEL** can be seen at the Empire Mills, Fremont street—the invention of Messrs. Adams & Hatch. We have had the pleasure of comparing its mode of operation with that of the ordinary chisel on different kinds of wood, and do not hesitate to pronounce it a decided improvement and an indispensable article for the cabinet shop, or any well-regulated sash and door manufacturing establishment. It is simple, rapid and effective. The core of the wood, instead of being packed in the crevice by the stroke of the chisel, is caught at once by the nimble-fingered instrument, and scattered by the winds, thus producing a great saving of both time and labor. We understand that the inventors have applied for a patent.

**THE BUSSEY LOCK.**—Mr. Bussey has recently made another very important improvement in his lock, by which he is enabled to operate the combination and turn the bolt with one knob only. This improvement still further reduces the size of the lock, and renders it stronger in general construction. This invention will soon be better understood and appreciated. No person should purchase any other safe lock before carefully examining Bussey's new and improved one.

**AN AMERICAN MOWER**, exhibited by Walter A. Wood of New York State, was the winner over all others at the international trial near Paris. The success of this mower is said to have been fully as much due to the good generalship of a smart Yankee driver, as to the superior working qualities of the machine.

**CONTINENTAL Life Insurance Company,** 302 Montgomery street, corner of Pine.

**BUSINESS NOTICE.**—Mr. A. T. Dewey, of this journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

**MARKET STREET HOMESTEAD ASSOCIATION.**—J. S. LUIT, Secretary. Office, 305 Montgomery street, corner of Pine, San Francisco. 2v15

**NORTH AMERICA Life Insurance Company.**

Usual Restrictions on Occupation and Travel **ABOLISHED!**

Policies of this Company are guaranteed by the State of New York, which is true of no other Company on this Coast.

The most Responsible and Liberal Company in the World  
**J. A. EATON & CO.,**  
Managers Pacific Branch, 302 Montgomery at. 2v11m9p SAN FRANCISCO.

**Perry Davis' Vegetable Pain Killer.**

A CERTAIN ANTIDOTE FOR POISON.—Rev. T. Allen, writing from Tavoy, Burmah, says: "Within the past four years I have used and disposed of about five hundred bottles, but am now out. Please send me a fresh supply as soon as you can—say two hundred bottles. I dare not be without it myself, and there are endless calls for it, both by Burmahs and Karens. I always take it with me in the jungles and have frequent occasion to use it, both on myself and others. One night, while sleeping in an open Zayat, I was awoken by a most excruciating pain in my foot. On examination, I found I had been bitten by a centipede. I immediately applied the Pain Killer, and found instant relief. In less than an hour I was again asleep."  
Rev. Mr. Hibbard, writing from Burmah to his father, says: "I have used Davis' Pain Killer for Coughs, Colds, Summer Complaints, Burns, and for the Sting of Scorpions, with uniform success. We always keep it where we can lay our hands on it in the dark, it need be."  
Sold by all Medicine Dealers everywhere. 6v15-1m

**AGENTS WANTED.**

**ENERGETIC MEN OR WOMEN CAN MAKE MONEY** in canvassing for our NEW BOOKS and ENGRAVINGS. One Agent reports thirty three orders for one Book in three days. Address: **PACIFIC PUBLISHING COMPANY,** 4v15qr9p 305 Montgomery street, San Francisco, Cal.

**Builders' Insurance Company—**  
OFFICE IN THE BUILDING OF THE CALIFORNIA SAVINGS BANK, California street, one door from Sansome street.  
FIRE AND MARINE INSURANCE. 16v149pqr

**BAURHYTE & McAFEE,**  
Steam Boiler and Sheet Iron Works.  
Owned and conducted by Practical Boiler Makers.  
High and Low-Pressure Boilers, Stationary and Marine.  
Howard street, bet. Fremont and Beale, San Francisco.

Having had twenty two years experience in this business, we feel confident of being able to compete—as to quality of work—with any establishment on the Pacific Coast. 7v15-qy

**PATTINSON'S HURDY-GURDY WATER-WHEEL.**

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among millers as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use. Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. 7v15-qy THOMAS PATTINSON.

**W. E. LOOMIS,**  
News Dealer  
AND STATIONER,  
Southeast corner Sansome and Washington streets,  
SUPPLIES ALL  
**EASTERN PERIODICALS**  
By the Year, Month or Number.  
6v15-1y9-16p

**ROOT'S Patent Force Blast Blower.**

Adapted for Smelting, Foundry, Mining and Steamships.  
Requires 50 per cent less power than any Blower now in use. For further particulars, address **KEEP, SLAKE & CO.,** Stockton; or Wm. T. Garrett, corner Mission and Fremont streets, San Francisco. 6v15f19p

**Oakland College School.**

THE PATRONS of this Institution have the choice of several distinct Departments. The SENIOR CLASSICAL is designed as preparatory to the College of California. The SENIOR ENGLISH affords a complete course of instruction in the English branches, in Theoretical and Practical Business, Science and Art. The JUNIOR is especially qualified to meet the wants of young boys, for whom separate apartments and Teachers are provided. Throughout all the various departments, great attention is given to the study of the Modern Languages. For further information, or Catalogues, address,  
**I. H. BRAYTON, Principal.**  
OAKLAND, California. 6v15qr9p.

**LINSEED OIL.**

**SOUTHERN RENOVATION.**—The Hon. Wm. D. Kelley, who has recently returned from a Southern tour, proposes a plan for the renovation of the Southern States, which contains within the compass of a very few words a volume of political philosophy. He says: "What is required to regenerate the South is subsoil plows, phosphates, agricultural implements generally, a large increase of horses, mules, and horned cattle, and a steadily increasing supply of steam engines and mining machinery, and such manufacturing machinery as can be moved by water power. These, with a comparatively small amount of cash capital, and a few earnest men to teach others their use and value, would, in a few years, make the South bloom like a garden, and develop a population as loyal as was that of any Northern State during the war. And the interests of Northern capitalists require them to supply those potent agencies at the earliest practicable day."

A New York company have a project on foot for a line of telegraph from some port in Chili along the coast to Panama.

25v12-3m

**A NOVEL WAY TO MOUNT A HORSE.**—In Peru, the women do all the work and the men are a good for nothing set of gamblers and thieves. The women ride on the hind quarters of their horses, without a saddle, cross legged, with the lead on the horse in front. They mount the animal by taking hold of his long tail, making a loop by doubling it up, and clasping with one hand the upper and lower parts of the tail, then, putting one foot in the loop, and the other foot on the joint of the horses' leg, they ascend as if going up stairs. They usually stand erect on the horse before sitting down. The horses never kick nor stir.

It has been generally supposed that the cedars of Lebanon, so famous and plentiful in Solomon's time, had mostly disappeared; but several extensive groves have been discovered in the mountain wilds by Rev. Mr. Jossup, missionary of the American Board. A grove in Southern Lebanon contained 10,000.

Dr. Winter has practiced Dentistry twenty years—fifteen in this State. For a full upper set of gum teeth, on vulcanite base, from \$20 to \$35. Teeth extracted without pain by local application. 18v14-1f

RADICAL CURE —OF— RUPTURE! Treatment of all Deformities of the Body, by DR. A. FOLLEAU'S process. 124 Washington street, up stairs, Washington Baths Building, between Montgomery and Kearny streets. DR. A. FOLLEAU Has his studies and manufactures in the same building. Every kind of Apparatus, Trusses, orthopedic Instruments, Artificial Limbs, etc., are manufactured and applied by himself. He has no connection with any Agency. 24v14-11ptf

MOSHEIMER'S PIONEER MINING SCHOOL —AND— Metallurgical Works. Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches: 1 Assaying of ores, metals and other mineral substances. 2 Technology, or Chemistry, as applied to any special branch of manufacturing. 3 Metallurgy of gold, silver, lead, copper, etc., by smelting, amalgamating, lixiviation, etc. 4 Gold extraction by chlorine gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed. 5 Concentration. Dressing of ores. 6 Construction of furnaces, in which any kind of fuel may be used for smelting, roasting, etc., as well as the erection of any machinery apparatus required in metallurgy and technology. Mining is considered by many a very hazardous undertaking; but I can assure anyone that our mines are as safe an investment as any other business when properly understood and managed; therefore, learn first. If you have a mine, then study the nature of the ore, and how to work it, and you will never fail to be successful. It may not be superfluous to state that I am theoretically and practically acquainted with all the branches I offer to teach. Years of actual experience in the laboratory, smelting works, quartz mills, and other manufactures carried on on my own account, have not only given me lessons, but more than ordinary ability. I was the first one in California who successfully extracted silver by smelting, on a large scale, and have since been travelling through the manufacturing and mining towns of Europe, to study all improvements, and am now again the only one in San Francisco who undertakes to work any kind of ores by either roasting, smelting, lixiviation, or chlorination process. I also undertake the erection of smelting and roasting furnaces, and furnish plans and estimates for any kind of works. My lately invented Roasting Furnace has the following advantages: A Furnace of the capacity to roast one to one and a half tons of ore per day can be built for \$300. It requires half a cord of wood per ton of sulphurets. The total expenses of roasting are not over \$6. The roasting is more perfect, as the ore appears in a spongy condition and eagerly takes up the chlorine gas or quicksilver when amalgamated. A large size furnace in successful operation may be seen, by permission of Mr. Maltman, in his works in Nevada City. Several others are in progress of building. Charges for assaying gold or silver ores.....\$3 00 Copper ores.....\$1 00 Practical Chemist, Metallurgist, etc. Office, No. 328 Montgomery street, San Francisco, Cal. 5v15-3ms

EUROPEAN METALLURGICAL WORKS, —AND— Practical Mining School, Bryant Street, Between Third and Fourth, SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process at tended to. Sulphuret, pyritic, and the so-called "rebellious ore," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL. The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business. S. F. KIMBALL. J. R. MURPHY. 10v10

J. A. BAUER, Chemical Laboratory, AND DRUG STORE, 644 Washington Street. [Established 1849.] SAN FRANCISCO. Careful Analyses made of

Ores, Minerals, Waters, Oils, Liquors, Wines, Products of Art, etc. Pharmaceutical Preparations Made to Order. Opinions given on Chemical Questions and Geology. Particular attention paid to Analyses of all kinds, in cases where legal questions are involved. Pure Nitric Acid, Nitrate of Silver, Gold Chloride, Platin Chloride, Sodium Amalgam, Sulphate of Copper, etc., for sale. 12v14-6m

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. au10

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the millor forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again revolve, where it passes down and into the circumferencio as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Setlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY, San Francisco.

\$85 for Hunter's Improved Concentrator.

The patentee is prepared to sell his Concentrators for the above price, and guarantees, when the machines are run according to directions, to give 20 per cent better results than from any Concentrator built on this Coast, and will refund the money if they will not perform what is claimed for them. Machines with copper plates, will cost \$10 extra. The Machine can be

Seen in Operation

At Booth & Co's Union Foundry, up stairs. Parties purchasing Concentrators will do well to examine before buying others of pretended merit. Persons desiring it can have a practical concentration made of tailings at any time, and prove the working of the machine.

FOR \$50.

HUNTER'S EUREKA AMALGAMATOR.

For sale, the right to build and use in mills. A working plan will be furnished each purchaser. Five machines can be seen in operation at the Eureka Mill, Grass Valley, the cost of the iron for the machine, without the iron-box, is about \$100. The box will answer of wood.

By reference to the Mining and Scientific Press of May 25th, a full description of the above Machines may be found. For particulars, send for Circulars, or address ANDREW HUNTER, Union Foundry, San Francisco.

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other material is crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages. BLAKE & TYLER, Agents for the Pacific Coast.

QUARTZ MINERS, MILLMEN,

And others contemplating the erection of Reduction Works, for either Gold or Silver Ores, your attention is called to a new, superior

First Class Mill,

In all respects, with Pans and Separators complete. The Mill is adapted for 20 or 40 Stamps.

For full particulars may be had by calling on Messrs. Palmer, Knox & Co., Golden State Foundry, J. B. HITCHCOCK, Millwright, Russ House.

Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

PICKERING'S GOVERNORS

For Steam Engines.

Giffard's Injectors,

For Feeding Boilers.

STODDART'S IRON WORKS,

Beale Street, San Francisco.

BLAKE'S QUARTZ BREAKER!

PRICES REDUCED!

MACHINES OF ALL SIZES FOR SALE

319 and 331 Pine Street,

Between Montgomery and Sansome, San Francisco.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling quartz, or other rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1 or 2 1/2 inch Crusher, capable of simultaneously crushing three to four tons of quartz per hour, no piece being larger than a walnut—price \$600

No. 2 or 3 inch Crusher, capable of simultaneously crushing through five to six tons per hour..... \$500

No. 3 or 4 inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

The frame is made of cast iron, bonded with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz will be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada, and many other places in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1865.

JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your best sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly pulverizing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$200 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866

BRODIE'S PATENT WIND BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in California, Nevada, and Nevada, and many other places. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press" of Sept. 22d, 1866.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866. Express Building, 402 Montgomery street, San Francisco.

LEFFEL'S

American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALED IN THE United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, &c., &c.

Quartz Mill Construction and Superintendence

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a quartz Mill. Has had five years steady and successful experience in working ores in Washoe, and is particularly skilled in saving sulphurates, and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address F. M. SHAW, San Francisco, care Mining and Scientific Press. 267 1/2 31y

Notice to Miners, Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Messing and Brass, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing, &c.

M. PRAG, 87 1/2 31y Stove Store, No. 125 Clay street, below Davis.

Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

E. O. HUNT,

Manufacturer of

Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to have all the sails so arranged as to turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person.

HUNT'S SELF REGULATING MILL is strong, durable and cheap. It is provided with means for stopping, in the most violent winds. This mill is well known throughout the State.

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double Acting. Frames and Gearing for running pumps, from steam or other power, constantly on hand and built order. Water Tanks built to order.

No. 28 Second St., and 108 and 110 Jessie St., 27 1/2 31y San Francisco.

Golden City Chemical Works.

CAPITAL STOCK - - - \$500,000

Trustees: H. P. WAKELEE, THOS. H. SELBY, NICHOLAS LUNINO, THOS. BELL, CHAS. E. McLANE.

H. P. WAKELEE.....MANAGER.

THIS COMPANY ARE NOW PREPARED TO FURNISH Sulphuric, Nitric and Muric Acids of superior quality, in quantities to suit.

Orders will be received at the office only for Chemicals of every description, which will be manufactured as may be required. The Company beg to say that they have the advantages of all improved machinery and apparatus for the manufacture and manipulation of these products, and our Laboratory is fitted up with the most recent improvements which experience and science suggest, and is surpassed by none in completeness and perfection for the purposes it is designed.

9 1/2 31m

FIRST Paint Manufactory

IN CALIFORNIA.

EPES & E. H. R. ELLERY

Have the Patent Right for the Pacific Coast to manufacture, sell and use

Ellery's Patent India Rubber Cement & Paint.

It is for all exposed surfaces; impervious to wet; will not rot, peel, blister or crack, in any climate. A superior Paint for brick, wood, cloth, metals, etc.; successfully used in the Eastern States. The old tin roof of that large building, the New York Rice Mills, which had been in such bad condition it was about to be taken off ten years since. Instead, they put on the INDIA RUBBER CEMENT AND PAINT, making a good tight roof. A coat of India Rubber Paint every two years since keeps it in good condition. We can refer to many others. The Adams Lead Works use our Paint only.

NEW CLOTH ROOFS put on; copings and all seams cemented and saturated; then coated with the India Rubber Cement and Paint—the same as on the St. Nicholas Hotel at New York City, the City Buildings and many others, the roofs of all the horse and steam cars, decks of steamboats, etc., around New York—for eight dollars per one hundred square feet, according to size and condition of roof. Good men do the best materials used.

We have just cemented and painted old tin roofs of Dr. H. D. Cogswell, Tubbs & Co., D. J. Oliver, etc., and the wood work of Sheriff Davis's building, 88 feet front, on Folsom street, between Third and Fourth streets—only one coat. The work will speak for itself. Now painting the cornice and iron work of Dr. H. D. Cogswell's building, corner of Front and Clark streets—one coat. See the above and further references at our office.

ELLERY'S PATENT INDIA RUBBER CEMENT AND PAINT is composed of India rubber and other gums, dissolved in linseed oil, mixed with the various coloring matters, and ground in any color. When applied to roofs or other purposes, it is mixed with pure linseed oil to the required thickness, and put on as other paints are, with a paint brush—retaining sufficient elasticity to give and take with the heat and cold. Fifteen hundred fishing vessels at Cape Ann use the India Rubber Paint, finding it superior to all others.

E. P. E. H. R. ELLERY are now prepared to make good roofs, and cement and paint new or old ones, and do all kinds of outside painting with Ellery's Patent India Rubber Paint. No asphaltum or coal tar used.

Office, No. 22 1/2 Jackson street, corner Battery, San Francisco, Cal. 6 1/2 31y

THE GREAT LIGHT.

THE DANFORD Atmospheric Lamp.

This Lamp burns coal oil, requires no chimney, gives a pure white and steady flame, uses thirty per cent less than any other Lamp in proportion to the amount of light afforded, and is absolutely indispensable in every house where gas is not used. CALL AND SEE THEM.

For sale only by DANFORD & AYERS, 27 1/2 31y 417 Washington street, Post Office, S. F.

Assayer and Chemist.

A GENTLEMAN WELL VERSED IN ASSAYING AND Analytical Chemistry, is desirous of securing a position in some assaying establishment, or would take charge of the assaying and amalgamating departments of either a gold or silver mine. Steady employment, rather than high wages, is desirable. The advertiser would take his own laboratory to the mine if desired. Proper references given. Inquire at this office. 3 1/2 31y

Important to Californians.—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. The Mining and Scientific Press Patent Agency has strictly complied with the requisitions of the Department, and properly filed all necessary papers as Claim Agents.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

66,499.—AMALGAMATOR AND CONCENTRATOR

George Johnson and Edwin G. Smith, Auburn, Cal.

We claim, 1st, The revolving belt or apron, F, with its raised edges, o, having a shaking or rocking motion from side to side, substantially as and for the purpose described.

2d, The amalgamating plate, E, in combination with the revolving shaking belt or apron, substantially as and for the purpose described.

3d, The box, M, with its jets in the direction of the motion of the belt or apron, together with the roller, N, substantially as and for the purpose described.

The object of the above invention is to provide an improved amalgamator and concentrator for saving gold, amalgam, quicksilver or sulphurets from sand or tailings, or from the pulp of quartz mills. This is accomplished by constructing a machine with copper plates and an endless revolving apron of caucas. After passing over the copper plates, the sand falls upon this revolving apron, which moves upward against the current, with a shaking and revolving motion, which former greatly aids in the saving of the sulphurets, etc. This invention has already been fully noticed in our columns.

66,665.—ANCHOR.—G. A. Lloyd and C. A. Stewart, San Francisco, Cal.

We claim the lugs, a, a, on the flukes in combination with the stops or projections, d, d, on the shank, for the purposes set forth.

We also claim making the flukes to stand at different angles, so that one will catch first when the anchor is one side up and the opposite one when the anchor is the other side up, substantially as described.

The object of this invention is to provide an anchor which shall do away with the awkward stock or cross-piece of the old style; one which cannot be "tripped" by the anchor becoming "fouled" with its own chain; one which shall decrease the weight without losing anything in efficiency, and one which, when hoisted to its place, will lie neatly against the side of the vessel. It is claimed that all these points are accomplished by this invention, which was more fully described in our issue of March 2d, 1867.

66,540.—JOINT OF METALLIC CASES, ETC.—Maximilian Wappich, Sacramento, Cal. Ante-dated June 29, 1867.

I claim my improved mode of rendering impervious the joints made in barrels, tanks, or other vessels which are constructed of sheet or plate metal, by the insertion of a packing of soft metal or alloy in grooves provided for that purpose, which are not in line with the rivets or bolts, and are so constructed and arranged that such packing may be inserted after the riveting has been completed, substantially as and for the purpose described.

RECENT INVENTIONS.

PNEUMATIC PUMP.—Mr. John S. McCann, a printer in the office of the Gold Hill News, Nevada, has just filed a caveat for an invention in which air is employed as an auxiliary power in raising water. By means of force-pumps (hydraulic and pneumatic), water and air are forced into the lower end of a discharge pipe in alternate volumes. Each injected volume of air, from its specific lightness, forces its way up through the water above it in the discharge pipe, carrying a portion of the liquid with it—acting much as do the pistons or pallets of a chain pump when in operation. The air, of course, when once within the discharge-pipe, is self-acting in its upward movement through the water; the natural law of atmospheric pressure is, as it were, reversed—causing an upward flow. To be most effective, the quantities of water and air injected must be properly proportioned and the movement of the machinery properly timed. In raising water to great heights, the effectiveness of a pump of this kind can be greatly increased by renewing or adding to the supply of air, at proper intervals, by additional air pumps. This being an improvement upon, or application of a

new principle to, an apparatus long in use (the force-pump), rather than an entirely new invention, a minute description of its mechanism is unnecessary.

**TAKING TIRES OFF OF WAGON WHEELS.** The Dalles Mountaineer speaks of an invention by Mr. F. W. Ayers, of that city, which is considered a useful and convenient instrument for blacksmiths. It is not described.

**AN IMPROVED SAFE.**—Something new in the way of fire-proof safes has recently been invented in New York. They are made cylindrical in form, double, the minor cylinder revolving, adding greatly to its security against attempts of burglars, as well as fire, while the form of general structure gives great strength. A sample of the safe was recently on exhibition at 344 Broadway, and attracted much attention.

**AN IMPROVED WATCH.**—John Finley, of Sharon, Ohio, has invented an eight-day watch, with only two rounds on the winding barrel.

**A NEW VEHICLE** for hauling dirt, by J. S. Lake, Smith's Landing, N. J., was exhibited before the American Institute in New York. It lays a track as it is hauled by a team, and is now in use for grading a railroad track. A span of horses is able to haul five tons over sandy ground, when on a common wagon they could scarcely haul half a ton. A smooth, level surface is required. The members thought it might be useful, among other things, for hauling out manure over meadows.

**A CALIFORNIA INVENTION IN NEW YORK.** A new apparatus for reefing and furling sails from the deck of a vessel, thus dispensing with the necessity and danger of going aloft, is now attracting considerable attention amongst those interested in marine improvements in New York. It is very simple, and reduces the number of ropes now used in the operation of furling and spreading sail to two—the sheets and clewlines. These are attached to two booms, one at each end of the bottom of the sails upon which, in furling, it revolves, being, as it were, rolled up. In setting sail, all that is necessary to do is to slack the clewlines and haul in the sheets, when the sail is let down, assisted by its own weight. In furling, the press of the wind upon the sail aids in rolling it up, besides which it is all the time taut, thus enabling it to be carried to the very last minute in bad weather. A great saving is made here both in canvas and rope, it being well known that the friction of the many ropes used in the old style of rigging is very destructive. The invention is the property of Charles Peterson, a practical seaman of many years' experience, by whom it was conceived and brought into working operation some few months since in this State. The invention has been applied to the clipper ship Guardian, of Comstock's line for San Francisco, which is now on its way to this port.

**SANTA CLARA COLLEGE, S. J.**  
SANTA CLARA, CAL.  
Conducted by the Fathers of the Society of Jesus.

The SEVENTEENTH ANNUAL SESSION of this College will commence on August 23, 1867.  
TERMS—Tuition in the Classical and Scientific Department, Boarding and Lodging, Washing and Mending of Articles Washed, School Stationery, Medical Attendance and Medicines, Fuel, Light, Baths, etc., per session of ten months, \$350.

Merchants can have their cards prominently inserted in the Letter Sheet MARKET REVIEW. 2v15

**Favorable to Inventors.**—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

**HINKLE & CAPP'S CENTRIFUGAL ORE GRINDER AND AMALGAMATOR.**

Patent dated April 10th, 1867.

For Grinding and Amalgamating Charges of Ore.

Arranged as shown in the first engraving, the pan is adapted for grinding and amalgamating separate charges of ore of 800 lbs. each, doing its work rapidly, thoroughly and effectually.

This sectional engraving exhibits more clearly the arrangement and shape of the grinding parts of the machine. It, and the other engravings, will be more clearly understood by reference to the accompanying explanation.

Half Section or Top View.

**The Centrifugal Ore Grinder.**

This new GRINDER and AMALGAMATOR is extremely simple and compact in its construction. The principle availed of is entirely novel. The grinding is effected by perpendicular mullers, pressed laterally by centrifugal force against perpendicular iron dies, fitted to the inner sides of the pan. It is to be run at a speed of from 60 to 80 revolutions per minute, according to the hardness of the rock to be crushed. The pressure upon every part of the grinding surfaces is direct and uniform, and they wear with straight and true faces from first to last, conforming also to the shape of the sides of the pan, so that the work performed with old mullers and plates is as thorough and perfect as with new ones. The pulp enters readily between the mullers and side dies, the pressure being light in front and heaviest at the heel of the muller, there is no strain upon any of the parts, and no liability to breakage or disarrangement, and no wear except that which is useful on the grinding surfaces. The work done is performed without jarring, jerking, straining or clogging, with extreme regularity and evenness, the pulp being of great and uniform fineness. It is not liable to be clogged, nor to be obstructed, stopped, impeded or broken, by coarse pieces of rock, stick points or iron, accidentally introduced with the crushed ore, as these can readily pass each muller separately, without interfering with or affecting the other mullers, each of which is independent, or can rest upon the bottom below the mullers, without inconvenience, as the arms play freely an inch above the bottom of the pan. It is more readily cleaned up than any other pan, as each muller can be lifted out separately by hand, and there is no necessity for lifting the revolving cone or driver, which is also easily turned, there being no friction when not in use, or rapid revolution. The bulk of the mercury is not ground up with the rock, but lies below the lower ends of the mullers in a groove, and in another groove on the cover of the pan, where all the pulp and metal passes continually over it without cutting or carrying it away. The mullers and side

For Grinding and Discharging Continuously.

Arranged as shown in the second engraving, all the interior grinding parts being the same as shown in first view, this pan is adapted for receiving and grinding and discharging continuously crushed quartz as fast as supplied by a five stamp battery, with No. 4 or 5 screens. A "sluicer," or some similar contrivance, to carry off the clay, slime and surplus water, is to be placed between it and the battery.

EXPLANATION.—E, muller-hanger, F, muller plate or shoe, G, side dies, I, supporting lip, D, bearing surface, K, feeder, X, weight to counter-balance wear of muller plates or shoes, U, cover used in working charges of ore. The dark shade on the bottom of the pan represents one of the grooves for mercury.

dies are easily removed at any time, or when worn out, and an extra set of mullers is furnished with each pan sold. It is also adapted for grinding cement, sulphurets, roasted ores, etc.

We claim all these advantages for our Pan, and that it will do more and better work, with less power, and less attention and manual labor, more rapidly and with less expense, than any other pan or muller made for the same purposes, and claimed to be of equal or greater capacity. We will sell them for use on condition that if, when fairly tried they fail to answer these promises, they may be returned.

For full description and illustration, see Mining and Scientific Press, June 15, 1867.

**Hinkle & Capp's Centrifugal Ore Grinder and Amalgamator**

May be seen in operation, and examined, at the European Metallurgical Works, on Bryant, between Third and Fourth streets, San Francisco, where all interested in mining and milling operations are invited to inspect it. Its weight, as arranged for continuous grinding and discharge, with extra set of six mullers, is about 2,700 lbs.; or as arranged for grinding and amalgamating single charges of 800 lbs. of ore, also with extra set of mullers, about 3,000 lbs. Price, as above, completely fitted and ready for use, either way, \$340, gold coin.

For further particulars, apply by letter to PHILIP HINKLE and CHARLES S. CAPP, No. 513 Clay street, below Montgomery, San Francisco, Cal. or personally to the above, or S. P. KIMBALL, Esq., at the European Metallurgical Works, on Bryant street, between Third and Fourth streets, or at the Miners' Foundry, First street, near Folsom, where they are manufactured.

Send for Circulars. PHILIP HINKLE, and CHARLES S. CAPP, Patentees, 513 Clay street, San Francisco. 25v14-1f

**Portable Steam Engines!**

"Hoadley's" and "Hittinger's" Make,

HOADLEY'S.

FOUR SIZES,

8, 10, 12, and 15-Horse Power,

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES,

5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES,

5 and 7-Horse Power,

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price. These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and mining purposes. Steam can be got up in these Engines in fifteen minutes after reaching the place of operation, and the true expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises), in fact, the portable principle is the miner's friend, and enables him to draw engines on their own wheels to his cabin door, and plant on the outposts confines of civilization the saw and grist mill, and it has done and will do more to help subside the continent than any other of the modern motors which are crowding society and normalizing the world. All sizes on hand from 3 to 30 horse power, with and without carriages. Also, Portable Saw and Orist Mills. For sale by TREADWELL & CO., 9v14-6m1p Corner of Front and Market streets.

**Stair Work of all Kinds,**  
MADE TO ORDER  
And Shipped to all parts of the Coast.

**N. P. LANGLAND, STAIR BUILDER,**  
No. 49 Beal street,  
Between Market and Mission,  
SAN FRANCISCO.  
10v14-1y

**THE CENTRAL PARK OF THE PACIFIC.**

**Woodward's Gardens, ART GALLERY, MUSEUM, GYMNASIUM, —AND— ZOOLOGICAL GARDENS.**

THESE BEAUTIFUL GARDENS ARE VISITED DAILY by hundreds of the pleasure-seeking public, and all agree in pronouncing them the best and only first-class suburban resort on the Pacific Coast. The extensive grounds are covered with the rarest trees and shrubbery, making it a most desirable spot for small parties wishing to enjoy a Pic-Nic. To all departments new attractions are being constantly added. These Gardens are accessible by the Howard, Folsom and Market street Cars. Entrances on Mission and Valencia streets, between Thirteenth and Fourteenth. OPEN EVERY DAY. Admission to all parts, 25 Cents. Children, under 12 years, half price. 2v14-1r

**THE WILLCOX & GIBBS IMPROVED NOISELESS Family Sewing Machine**  
Challenges the world. It has beaten the Florence badly Come and see it, or send for Report of trial. SAMUEL SWIFT, Agent, 203 Kearny street, near Sutter. 13v14-6m

**Pratt's Abolition Oil.**

FOR ABOLISHING PAIN—THE BEST REMEDY IN existence for Rheumatism, Neuralgia, Paralysis, Headache, Toothache, Sore Throat, Diphtheria, Weak, Swollen and Stiff Joints, Contracted Cords and Muscles, Cramps, Colic, Diarrhea, Cholera, Pains in the Breast, Lame Back, and all aches and pains. It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 25 cents and \$1 per bottle. For sale by all dealers in medicine. Sole Proprietors, A. McBOYLE & CO., Druggists and Chemists, 534 Sacramento street, opposite What Cheer House, San Francisco. 10v14-1y

**GOVERNMENT HOUSE,**

Corner of Sansome and Washington sts. SAN FRANCISCO, CAL. THE STREET CARS PASS THIS HOUSE IN every direction, every ten minutes. The rooms of the House are well furnished, large and airy, are let by the month, week or day, and are kept in superb order. There is a Restaurant attached for ladies and families, where persons can board for one-half they are required to pay at hotels. SANBORN & CO 10v13-6m

**Economy in Advertising.**—The MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

WAGES OF MINERS IN ENGLAND.—The general average wages of the working miners in England, according to a correspondent of the London Mining Journal, (exclusive of captains, inspectors, etc.) does not exceed an average of \$12 per month, or \$2.75 per week; and that with flour higher than it is at the mines in this State, and potatoes and beef nearly as high. How a man and his wife, and two or three children, the latter too young to work, can live for \$2.75 per week, is something of a mystery to an American. The same class of workmen in Virginia City are demanding \$4 per day, with the cost of provisions not more than twice the cost of the same in the English mines.

SECRETARSHIP FOR MINING COMPANIES.—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v14tf

Gold Bars, of whatever size, if well cast, assayed for two dollars, at A. P. MOLITOR'S Assay Office, 611 Commercial street, opposite United States Branch Mint. 15v14 3m

JACOB SAEW, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street), takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 10v14tf

Brown's Filtering Heater.—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is in operation in fuel and boiler-repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to 5v14 1 v AUSTIN A. WELLS, Agent.

FOR CABINET PHOTOGRAPHS, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos 25 and 27 Third street. Every picture warranted to give perfect satisfaction. 5v15qr B. F. HOWLAND, Artist.

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with pure gold—thus restoring them to their original usefulness and beauty. Call and examine the work. Finest quality of artificial work also manufactured. 16v14 tf

PIANOS, ORGANS, All kinds MUSICAL INSTRUMENTS, Sheet Music, Music Books, Strings, etc. Largest Importers in San Francisco. Send orders to KOHLER, CHASE & CO., 26v 4nr16p 421 Montgomery street, San Francisco.

LIST OF WM. H. KEITH & CO'S Proprietary Preparations.

- Florentine Tooth Wash; Saponaceous Tooth Powder; Rosemary and Castor Oil; Wine of Peppine; Guaiacum; Devine's Pitch Lozenges; Verbena Water; Bny Rum; Cologne Water; Aurantique; Oriental Perfume, for the Handkerchief; Sparrow Perfume, for the Handkerchief; Glycerina Lotion, for the face and hands; N. E. Rum, quart bottles—a superior article; Solution of Citrate of Magnesia; Oranular Effervescent Citrate Magnesia; Cold Cream of Roses; Keith's Cholera Mixture; Electro-silicou Polishng Powder. Kissengen Water, Vichy Water, Carlsbad Water, Seltzer Water. WM. H. KEITH & CO., 5v15qr 520 Montgomery st., San Francisco.

Foundry for Sale. A One-half Interest in the UNION IRON WORKS, SACRAMENTO, Owned by William R. Williams, is offered for sale on the most favorable terms. A Good Bargain May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lots 35 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets. Inquire at the office of the Foundry, or address WILLIAM R. WILLIAMS, Sacramento, Cal. 25v13tr9-16p

HENDY'S LATEST IMPROVED CONCENTRATORS,

FOR GOLD AND SILVER ORES, With Revolving Stirrers and Rotary Distributor. Can be seen in Operation at the Union Foundry, First St., San Francisco.

Directions for Operating Hendy's Concentrators: The sulphurets are drawn off while the Concentrator is in motion, in the following manner: FIRST—Set the Pan, A, level, by its inner rim. SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 2, marked S.] THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned. FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

The above directions, if followed implicitly, are all-sufficient. But, strange as it may appear, the proprietor has found that, in certain cases, they have, owing to the carelessness or to the ignorance of the operators, failed to serve as a complete guide. He, therefore, in the present edition of his circular, insists upon their being followed to the letter; and in order that there may be no mistake in future, he thus elaborates and explains them:

First, then: Unless the pan is level, it is out of the question to expect it to do its duty. One would imagine that the slightest possible examination of the illustrations would be sufficient to show this. Yet, in one case, where the machine did not work satisfactorily, it was found that no regard whatever had been paid to this point! The word level is in itself precise; it admits of no latitude, and cannot be misunderstood. Nothing is easier, to a mechanic, than to place the pan absolutely and mathematically level. It cannot be necessary to dwell further upon this point.

Direction Second, viz:—"Keep the pan about half full of sulphurets," has also, in some cases, been disregarded. A moment's reflection will point out its importance. The operation of the machine is such, that grains of any kind, whatever may be their size or weight, will seek the periphery of the pan, and unless discharged, will there remain, until other grains of greater specific gravity take their place. Of course, then, at the starting of the machine, and for a short time thereafter, the periphery will be partially filled with sand. It is therefore necessary to allow a quantity of sulphurets sufficient to completely occupy that space to accumulate, before the gate is opened, and their discharge commenced. It is obvious that they will otherwise be accompanied with more or less of sand. Once properly commenced, the discharge will be continuous. It must be regulated, however, by the richness, in sulphurets, of the pulp under treatment. A little practice will enable the operator to gauge it without difficulty.

After what has been said, direction Third requires no further explanation. Direction Fourth is, to a mechanic, sufficiently explicit.

These concentrators can be set in pairs, for which a single crank shaft will suffice. Two such pairs can be so arranged as to require a driving shaft of only six feet in length.

The guaranteed capacity of each machine is five tons every 24 hours. Eight tons, however, can be and has been put through in that time. The small proportion of sand which the sulphurets carry, when thus rapidly concentrated, is not an objection but rather an advantage, in case the operators themselves intend to work them. Either in roasting or in pan-working, a small admixture of sand is unquestionably an aid. But if the sulphurets are being prepared for sale, they must of course be clean. In this case, the discharges from four machines can be conducted into a single additional one, and the concentration thus be made complete.

The proprietor has recently still further improved the machine, by the substitution of an iron frame for the former wooden one. While nothing is added to its weight by the change, it is thus made stronger and more compact; and at the same time the labor of setting it up is considerably lessened. He flatters himself that these added advantages leave nothing further to be desired as regards the perfecting of the machine.

Pacific Mail Steamship Co's STEAMSHIPS FOR NEW YORK, JAPAN AND CHINA. LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA connecting via Panama Railroad, with one of the Company's splendid steamers from ASPENWALL for NEW YORK. On the 10th, 18th and 30th of each month that has 30 days. On the 10th, 19th and 30th of each month that has 31 days. When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following. Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco. Departures of 15th or 15th connect with French Trans-Atlantic Co.'s steamer for St. Nazaire, and English steamer for South America. Departure of 10th connects with English steamer for Southampton and South America, and P. R. R. Co's steamer for Central America. The following Steamships will be dispatched on dates as given below: August 19th—SACRAMENTO..... Capt. J. M. Cavalry Connecting with HENRY CHAUNCEY, Capt. Cray August 30th—MONTANA..... Capt. E. S. Farnsworth Connecting with ARIZONA, Capt. Maury. Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult. An experienced Surgeon on board. Medicine and attend. ance free. The steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock. Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas. If desired an amount of 210 to 220 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England. For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS FARGO & CO. The Steamship GREAT REPUBLIC, Capt. S. Doane, will be dispatched September 2d, at noon, and will be followed by the CHINA, Capt. George H. Brantley, October 14th, from wharf, corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting at Yokohama with the steamer COSTA RICA for SHANGHAI. For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets. OLIVER ELDREDGE, Agent.

## The Farmers' Rocking Horse.

A NEW CALIFORNIA AGRICULTURAL INVENTION.

We give herewith a very full illustration of a new cultivator, invented by Mr. A. W. Putnam, of Pleasant Valley, Solano county, a gentleman who has had many years experience in the practical study of agriculture and agricultural machinery. This invention was first patented, through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, April 2d, 1867, under the name of the "Rocking Chair Planter and Cultivator." Since the application for that patent, several important improvements have been added, for which a new application for patent has been made, through the same agency. The present improved machine is called the "Farmers' Rocking Horse;" that name having been suggested by the saddle-shaped seat used, and the addition of the roller, as seen in Fig. 2.

This machine appears to be one of the most complete and effective cultivators which has yet been introduced to the agricultural public; and we take especial pleasure in giving it the present full and intelligible illustration, both for its intrinsic merits and from the fact that it is the result of California ingenuity, and will be manufactured in our midst—thus adding another item to the rapidly increasing branches of California industry.

It can be used as a combined cultivator and planter, a combined cultivator and roller, or as either, separately. The seed-dropper can be regulated for any size or amount of seed. It will drop wet or dry seed. The wheel working the dropper is six feet in circumference, having holes bored near its periphery for a given number of pins, the arrangement of which can be seen by examining B and I, in Fig. 1. With twelve pins in it, it drops every six inches; with six pins, every foot; four pins, eighteen inches; three pins, two feet; two pins, three feet; one pin, six feet.

The markers and coverers are so constructed that the seed can be dropped on the top of the ground and covered by gathering the dirt from each side, thus forming a ridge; or it can be dropped at any depth required, and the amount of covering regulated as desired. The marker can be so arranged as to move away any dry dirt or weeds that may be lying upon the surface

## THE FARMERS' ROCKING HORSE.

FIG. 1 shows the machine without the roller or cultivator frame attached. A, the main frame; B, the driving wheels; C, G, the small bearing wheels; D, a section of the pole; E, the Draft iron, connected (when at work) with the pole at one end and the cultivator or planter frame at the other end; F, a hinge by which the pole and arms are connected with the main frame; O and E, connect the cultivator frame to the main frame; H, the seed box; I, the lever working the seed dropper; J, the seat; K, the canton box; L, a balance box to carry weights when needed; M, N, arms for lifting the cultivator frame from the ground; N, a rod holding the arms up when raised; O, straps by which the rod N is pulled back to lower the frame.

FIG. 2 shows the roller. When it is used, the roller-shaft takes the place of the axle in fig. 1.

FIG. 3—Cultivating one row.

FIG. 4—Cultivating two rows.

FIG. 5—Planting two rows and not ridging the ground.

FIG. 6—Planting two rows and ridging the ground.

FIG. 7—Planting two rows and not ridging.

of the ground, open a channel for the seed to where the dirt is clean and moist, and cover with clean moist dirt free from lumps or weeds. The construction and practical working of this machine may be readily learned from a careful observation of the annexed illustrations.

The application of steam to farm labor is

FIG. 3—R shows a center of the cultivator teeth, with the bolt-holes for putting on the shares or planter-iron; the same centers answering for all the different kinds of work; S shows a cultivator tooth with two sets of shares.

one of the most difficult things to be accomplished satisfactorily, from the fact that so few who use such machines are mechanics, in the proper sense of the word. The inventor of this machine appears to have been most happy in both the conception

and in the mechanical development of his invention. It has been brought gradually to its present state of perfection by much study and large practice. Between 300 and 400 acres have now been planted and cultivated with it during the last two years. During all this time the inventor has been constantly experimenting and perfecting his invention, until he has now arrived at what he considers a perfect machine.

The machine will plant one row at a time, three feet or more apart, or it will plant two rows at a time eighteen inches apart. I works with great ease, economy and accuracy—puts the ground in good order for the seed, and puts the seed in just the best place for it to get a good start. The invention is equally adapted to all kinds of cultivation, whether orchard, vineyard, field or grain. The machines will be manufactured in this city.

The inventor has promulgated some novel views with regard to grain culture, to which we shall refer at length in a future issue of the Press.

THE working classes in England make more money than all others combined. The income of the laboring people is estimated, in the aggregate, at \$2,000,000,000 annually. This is at least \$340,000,000 more than the total income of the wealthier classes.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[By our Special Correspondent.]

## General View of the Paris Exposition of 1867.

By W. P. BLAKE, Commissioner from the State of California.

The general plan and arrangement of the Exposition Universelle of 1867, is the result of the observation and experiences of the former great international exhibitions at London in 1851, at Paris in 1855 and at London in 1862. In those, grand architectural effects were attempted, and large sums were expended in exterior and interior decoration. In the Exhibition building of 1867, all architectural display is subordinated to the convenience of grouping and display of the various objects contributed. The leading feature of the place is the division of the space into seven consecutive galleries, each one devoted to a particular group or class of objects. The form of the building is generally considered to be nearly elliptical, but it is in fact a parallelogram, with rounded ends. Its greatest length is 482 meters (527 yards), its breadth, 307 meters (406 yards). The outer gallery is 1,200 meters, or three-fourths of a mile in length. A central space is reserved for a garden, with fountain and statuary. The whole building is bisected in its length by a main avenue, crossed at right angles by three others, which, together with avenues or passages radiating from the central space, give convenient passage from one gallery or group to another. The whole space, thus divided, measures 146,000 square meters, or thirty-six acres. The superficial area of the building, with the park, is nearly 100 acres. The total superficial area of the building of the Great Exhibition at London in 1851, was about 20 acres, of the palace and its dependencies at Paris in 1855, about 37 acres, and of the International Exhibition of 1862, at London, about 24 acres.

Of the total space of 151,750.46 square meters in the building of 1867, according to the official table, France occupies 63,640.88, Great Britain, 21,059.87, Prussia, 12,765.27, Austria, 8,362.58, Belgium 6,993.10, Russia, 6,060.70, the United States, 3,944.74.

In the Exhibition of 1851, the total number of exhibitors was between 15,000 and 16,000; in 1855, 23,954; in 1862, 28,653, and in the present exhibition, the number reaches 60,000. Of this number, France has 11,645 exhibitors, England 21,000, and the United States 778. According to the official report of M. Rouber, Vice-President of the Imperial Commission, read to the Emperor on the 1st of July, the weight of the different objects exhibited is not less than 28,000 tons. The communication established by rail between the palace and the railroads of the continent, furnished the means of conducting and installing with the necessary care and celerity, this enormous mass of material which, for the most part, arrived at the end of the month of March.

The motive power required to put the various machines exhibited in motion is more than that of 1,000 horses. The supply of water for the building and park is equal to that required for a city of 100,000 inhabitants. The iron pillars and girders used in the construction of the building weigh 13,500 tons; the windows and skylights required 65,000 square meters of glass; the masonry 52,000 cubic meters of stone and brick, and the woodwork 53,000 square meters of plank. The length of the sewers is five miles. The steam for the engines is generated outside of the building, and is conveyed by pipes under the surface of the ground.

The visitor to the Exhibition is at once forcibly impressed with the importance and extreme interest of the Park as part of the Exhibition. It is most tastefully laid out with avenues and winding paths, and is adorned with trees, shrubs and flowers, all planted since the ground was first broke for the foundation of the palace, on the before barren and indurated surface of the Champs de Mars. Here may now be found exam-

ples of the peculiar architecture of almost all the nations of the earth, from the tent of the wandering Arab to the gilded palace of Europe. In the vicinity of the Yankee school-house, one may see a palace of the Bey of Tunis, an Egyptian temple, the catacombs of Rome, the temple of Xochicalco, Mexico, with full sized models of its ancient altars, a Protestant church, and a Turkish harem.

The main entrance to the Exhibition is at the end turned towards the Seine, opposite the Bridge of Jéna. A grand avenue about 40 feet wide here, leads directly through the Park to the building. This is the official avenue, and it is bordered by tall ornamental columns, which sustain a canopy of green velvet, studded with golden stars. At the gate you pass between two monumental bronze fountains about 40 feet high, and with basins 50 feet in diameter. That upon the right is of cast iron, from the celebrated foundries of Durenne, at Sommevoire, which contributed many other objects of interest to the interior of the building. A little beyond, six tall columns of polished marble, of different colors, ornament the border of a path leading to a good sized gothic church on the left, which commands attention by the beauty of its form and finish, and its evident solidity and apparent permanence, although only a temporary edifice. Its roof affords an opportunity for the display of tiles of various patterns and colors, and its windows for the exhibition of stained glass-work by different artists. Near the church is an iron lighthouse rising from the water of an artificial lake. Two buildings of iron and glass, one on each side of the entrance, and next beyond the large fountains, are devoted to exhibitions of iron and of steel. One contains huge ingots of cast steel, three feet square, and broken across, so as to show the nature of the grain. Here, too, are enormous girders in one piece, railroad rails as straight almost as the bed of a planing machine, and again twisted into spirals and tied into knots, so as to display to advantage their extraordinary strength and toughness. Beyond, but yet at the side of the grand avenue, is a building devoted to the display of English ordnance and munitions of war, from a rifle to the celebrated Whitworth and Armstrong guns of different sizes, with the shot and shell peculiar to each. "John Brown & Co. limited," exhibit a bar of steel thirty feet long, three feet six inches wide and six inches thick, weighing eleven tons. It is planed as true as a ruler on the edges and ends, and appears to be compact and homogeneous throughout. Alongside of this building, there is a vista over green lawns and *partie* of flowers to the American *annexe* beyond, where may be seen the beautiful locomotive, and various agricultural machines. On the left of the avenue is a building for the display of windows of stained and painted glass, to which the art of photography has lent its aid. Portraits and photographs are there reproduced in all the brilliance and permanence of color of stained glass.

Continuing the walk toward the entrance to the building, we reach a model English cottage of striking beauty, adorned with several varieties of exterior finish in incised plaster, in parti-colored brick, in beton, slate, and in tiles of different patterns. In the interior the different manufacturers of glazed and encaustic tiles have vied with each other in producing the most pleasing patterns upon the floors and walls. The different forms of ranges and stoves are here displayed in almost endless variety. A few steps beyond bring us to the Imperial Pavilion, in Moorish style, and superbly furnished with the choicest productions of France. The marble steps are inlaid with fine mosaics, and are guarded by two Imperial eagles in bronze, standing upon gilt spheres. The building contains three apartments, and is occupied by the Emperor when visiting the Exhibition.

These details upon some of the structures met in passing through the park, will serve to show the general character of the other portions, crowded with buildings of the greatest interest in themselves, and for their contents. Many of them contain collections which are complete exhibitions in themselves. Spain, for example, has filled a large building with a representation of its mineral and agricultural productions. Russia has several buildings—one, a model farmhouse, is devoted to the products of its fisheries, to its furs, costumes of its interior tribes, and to its agricultural machines and products. A large stable contains the different heads of horses, represented by choice individuals. The Russian Commissioners have an office in a model Russian cottage. In the part of the Park given to Holland, a brick building, standing by itself among the shrubs and trees, is a complete diamond-cutting establishment, where several work-

men are constantly engaged in cutting and polishing diamonds—an art that is seldom exhibited to the public.

The machinery of the Exhibition is placed in the outer gallery or circle, and may be safely viewed from above, by means of a raised platform in the middle, that extends around the whole building. A large part of the French space in this department is occupied by the various weaving and spinning machines. There are also some very interesting hoisting machines, and engines with their appurtenances for deep mining, and machines for drilling rocks and cutting tunnels.

The most impressive display amongst the new materials is that of iron, in its ore, and in pig bars and steel. The forest trees, timber and boards of almost all European countries are very fully represented. The United States have not done themselves justice in this, as in many other respects in this Exhibition. With the exception of a few bundles of shingles from the west, J. D. Boyd, of San Francisco, is the principal exhibitor of our native wood.

The space occupied by the United States is a segment of the great elliptic. It forms a narrow wedge-shaped figure about 450 feet long and 100 feet broad at the exterior of the building, and converging to a point upon the garden, at the center. In addition, there is a large space in the building in the Park. The principal part of the space, exclusive of the machinery, is occupied by the minerals and pianos. The mineral display is extensive, but is not by any means what it could and should have been if a suitable effort had been made. Idaho receives a gold medal for specimens of the silver ore from the Poorman lode; California receives two silver medals for the two collections sent from San Francisco, and Colorado receives a gold medal for the display of minerals from its gold region.

The work of the juries commenced as soon as the Exhibition opened, and the awards were made very soon thereafter, and in many cases before some of the contributions were fairly placed and labelled. The grand ceremony of the distribution of prizes was on the 1st of July at the Palace of Industry, the building erected for the exhibition of 1855. The recipients of grand prizes and gold medals received them from the hands of the Emperor, in the presence of 17,000 spectators, all comfortably seated in that magnificent hall.

The idea of an Exposition, as well as an Exhibition, has already in a great measure been realized. The arrangement and grouping is such as to invite and stimulate comparison, as well as to afford the greatest convenience for the study of different departments. Nearly all the different countries represented, have prepared and published, or are now preparing special catalogues and reports, giving the latest information and statistics of their various industries. The commissioners charged with the duty of reporting, are eagerly seeking such information. Statistics of the Pacific coast are much sought for. Mr. D. Buel, the Commissioner from Nevada, has just received the minerals from that State, and will soon place them in the building. He will shortly publish a map of Eastern Nevada, accompanied by a volume of statistics.

MINING NEAR BOISE CITY.—Our occasional correspondent, "W. H. M.," writes as follows from Boise City, under date of August 7th: "V. S. Anderson and Capt. Kelly, have erected and are running, by water power, a small 2-stamp mill, with pans, etc. They work the affair themselves, and are in high spirits, as they have plenty of first-class ore. If this plan was followed up, by two or three in company, men of very small means could work quartz mines, just as well as capitalists, especially in such places as Yuba, where water power is abundant. There is no reason why this should not be done; a small company thus working simply as partners, could by this means profitably work twenty or thirty feet of lodes, or even less. At any rate, work done in this way, by the actual owners, would be much preferable for all quartz owners, and for the whole country, than that the gold should remain in the lodes; and further, it would tend to induce capitalists to take hold, as they would reason thus: If a 2-stamp battery will pay, a 10-stamp battery will also pay. Reports of rock crushed, and gold and silver taken out, would cause a true and just inquiry into the character and richness of the veins, and thus enable capitalists, with more certainty, to know what they are investing in, when taking stock in gold and silver quartz mining companies. This county has not been prospected; it

has merely been "scratched over," and from the hills close around us here at Boise City, I have seen some very good specimens of both gold and silver bearing quartz; but the owners are very close as to the whereabouts of their discoveries.

The Greenback (Defree's) at Yuba, has had a clean up from Atlanta rock, but have not made the result public. However, they immediately went to work again on some more ore from the same lode, and entered into negotiations for the purchase of more of the Atlanta lode.

There is considerable excitement near Owyhee about a new quartz discovery, but I do not yet know the details."

LOOSE STATE OF SOCIETY IN ANCIENT ITALY.—There is one matter in relation to the recent discoveries at Pompeii, about which but little has been said by letter writers, or others. That a horrible state of depravity existed there, at least during its latter days, and probably throughout all Italy about the time of the reign of the infamous Nero, as too surely witnessed by the recent revelations of the pick and shovel among the ruins of Pompeii. No wonder the fate of Sodom and Gomorrah was visited upon that city of abominations. The consuming fires which buried the twin cities of Italy, fell upon a community which could not have been a whit more deserving of a better fate than were their sisters in iniquity, whose remains are now covered by the loathsome waters of the Dead Sea. A late correspondent of the *Chicago Tribune*, writes as follows:

The horrible depravity of the Pompeians, is illustrated by the frescoes, mosaics, sculptures, and bronze statues that are now being found. Hundreds of these vile objects have been carried away to the museum in Naples, and put into a room which no woman is allowed to visit; but there are still houses in Pompeii that are kept locked, and others that have such sculptures over the doors on the outside that the guides hurry past when there are women in the party. Even in private houses there are scores of frescoes, magnificently executed, too, which one would not dare to visit in company with ladies; and in other houses pictures and statues than which none can imagine anything worse. I cannot understand why the writers on these matters have been so anxious to conceal the faults of the ancients. It is a fact that deserves to be generally known. Great God! what a picture of corruption in Imperial Rome is revealed to one who looks into Pompeii with anything like thoroughness. The very stone of the door tells a tale more damnable than was ever invented by modern thought. Sodom was clean and Gomorrah was pure, compared with Pompeii. Where was ever a people on earth, before or since Pompeii, that "advertised the ways that lead down to hell" by sculptures placed in the open light of the street?

EXTENSIVE COÖPERATION.—Sir Francis Crosley, of England, the most extensive tapestry, velvet and carpet manufacturer in the world, has gone extensively into the coöperation system. He gives employment to over 4,000 men, over 1,000 of which have been admitted to partnership with him in business. The experiment has thus far worked most admirably.

IMPORTANT MINING SUIT DECIDED.—The suit of Robert Robinson vs. the Imperial Mining Company, to recover possession of some valuable mill property near Dayton, was tried in the District Court of Lyon county, on the 16th inst., the jury returned a verdict for the plaintiff. The amount of property involved was \$125,000.

THE OIL OF ROSES comes almost exclusively from Adrianople. No farm crop pays like roses so applied. No country equals California for roses, and it may be profitable to inquire if otar of roses cannot be produced here with paying results.

THE first shipment of bullion from Alpine county this year, was made on the 13th inst. It consisted of 1,500 ounces from I. X. L. ore, worked in the Davidson mill.

FIRST VESSEL.—It is stated that the British ironclad steamer Zealous will be the first vessel placed in the new dry dock at Hunter's Point for repairs.

## Mechanical.

## Improved Motive Powers.

Two very interesting exhibitions of motors were recently made at a *conversazione* at the Pharmaceutical Society of London, England. One of these motors was a hot-air engine, and the other a new gas engine. Quite a lengthy description is given of the former, as follows:

The hot-air engine is based upon the fact, long known to scientific engineers, that the most economical mode of obtaining power from heat is by its direct application to the expansion of air, or other permanent gases, rather than by that of steam or any other vapor. A hot-air engine has recently been exhibited in London, which differs from the so-called "caloric engines" in general use in several essential particulars as to its construction, and is free from those defects which have hitherto prevented the practical carrying out of the caloric theory. In this engine, the motive power, instead of being derived from the expansion of air heated in a separate generator, as in former engines, is produced by the expansion of air heated by contact with the fuel itself, and, in addition to this source of the power, by the action of the expansive force of the gaseous products of the combustion of the fuel, which heretofore have been permitted to escape into the chimney without being in any way utilized by the production of power. This result is accomplished by placing the fuel in a grate which can be hermetically closed, and forcing the air required for combustion into it by means of an air-pump worked by the engine itself, so that no part of the heated air or the gases produced by the combustion of the fuel can escape without passing through the cylinder, and there doing duty in the production of force. It is obvious that by such an arrangement the employment of separate iron generators for the purpose of heating the air is dispensed with, and that thereby one of the chief difficulties of the old caloric engine is avoided; for in the hot-air engine the fuel is contained in a fire-clay furnace, surrounded by an air-tight iron casing, which in this way is entirely protected from injury. The fuel, which may be anthracite, smokeless coal or coke, is thus burned under pressure with great regularity, and with the production of a uniform temperature, and at a rate exactly proportionate to the duty the engine is called upon to perform, thus avoiding all waste of fuel—a result which has not been attained with any form of engine yet introduced.

The heated air, together with the gases produced by the combustion of the fuel, pass from the fire-box directly into the cylinder, so that every unit of heat produced is converted into force. The piston consists of a hollow plunger, to which the piston-rod is attached; the packing is placed around its upper circumference, where the heat is so moderate as to permit of efficient packing and lubrication. By means of an air-pump worked by the piston, a supply of air is forced into the grate. It here comes in contact with the fire, and a portion of it, in maintaining combustion, combines with the carbon, producing carbonic acid, etc.; while another portion of the air in excess takes up heat, and is thereby expanded. The mixed heated air and gaseous products of combustion speedily accumulate such an amount of expansive force as to set the engine in motion, by pressing on the piston. At the end of the stroke the expanded gases escape by the waste-pipe, which may be connected by a common stove-pipe with an ordinary chimney. Each upward stroke of the piston produces a downward corresponding stroke of the air-pump, and forces a fresh charge of cold air into the grate to maintain the combustion of the fuel, thus keeping up a continual supply of heated air and gaseous products. The power is increased or diminished by dampers, which pass the air through or over the fire, according to the amount required.

The chief advantages of the hot-air engine will be found in the very important facts that there is not the most remote danger in its use. The furnace is perfectly insulated, so that all risk of fire is entirely avoided, and the presence of water, whether in large or small quantity, is dispensed with; so that this engine can be employed under circumstances where it would be impossible to use a steam engine. The name of the inventor of this machine is not given in the authority before us—the *Chemical News*.

## AN IMPROVED GAS ENGINE.

The improved gas engine alluded to appears to be of sufficient interest to merit a short description in connection with the

above. This engine is the invention of M. P. Hagar, and is worked without the use of electricity to fire the gas. It may be run the whole day without any supervision whatever, requiring nothing but turning on and lighting the gas to set it in full work. When once started, it may be *locked up and left to itself*, requiring nothing but occasional oiling. There is no possible danger from explosion or fire, and its presence in any building will not affect insurance. The expense of power, at the London price of gas, is said to be about *one cent per hour* for each man-power used. The owner moreover possesses the power of instantaneously stopping and discharging it at any moment, paying for keeping up the power only when the engine is at actual work; while in a steam engine, a constant magazine of power must be kept in constant readiness from hour to hour, even while not in use, and at a constantly accruing cost. If even the half that is claimed for these two engines is true, each must possess advantages peculiar to itself, while both are free from many drawbacks attending the use of steam engines. They require no skilled labor (as of an engineer), no water, do not increase insurance, make no dirt, and are entirely free from danger. These are all great advantages, especially in a city or populous neighborhood, where a small power only is required, and that only at intervals.

## Mechanical Precision.

There seems to be no limit to mechanical precision, or at least none save that due to the expansion and contraction of the tools employed, from the breath or touch of the operator. The first element of precision is the true plane, and for the existence of that plane in its present state of perfection, we are indebted to Mr. Whitworth, of England. That gentleman was the first to produce what is now known as the surface plane. He astonished the mechanical world, in 1840, by the exhibition of his wonderful plane surfaces at the Glasgow meeting of the British Association. This acquisition of a true plane has since become the means for measuring length with accuracy far beyond anything previously known. By it, Mr. Whitworth has been enabled to measure and regulate lengths to the *one millionth part of an inch!* The apparatus for measurement operates by the contact of true planes, and varies from absolute perfection only by the minute changes due to differences of temperature. The amount of precision above named is the limit of *possibility*; the actual practicability of measurement by these appliances may be set down at the one ten-thousandth part of an inch!

The limits of the truth of work are the limits of measurement; we cannot work more correctly than we can measure. Hence the necessity for the utmost exactness in measurement. There are those who believe that we have reached human perfection in that direction, and yet we know there are distances we cannot measure. For instance, when we look upon the surface of the smoothest polished plate, we notice bright and dark spots. Reason teaches us that these spots are produced by elevations and depressions; yet they are beyond our means of measurement, minute as those means now are. We know that iron is elastic. Hence, when we change a heavy bar of iron from a horizontal position to a perpendicular one, we decrease its length. Can we measure the difference? If we bore a small cylinder in a vertical position, perfectly round, that cylinder will become elliptical when we lay it down horizontally. Can we measure the change? Although we may not be able to reach such perfection now, have we any right to limit human perfection by saying that we *never* can? We say, no! The human mind will be ever reaching out for something that is beyond, and it will be ever progressive. We believe that to limit human precision or human wisdom was never contemplated by the Creator—will never be reached, not even by the latest man of the latest generation of the dwellers upon the earth. Man was created a progressive being; it is a part of his mission upon earth to advance in knowledge and precision, continually, even to the end of time.

## Scientific Miscellany.

## A Chapter on Rats.

The common house or brown rat was unknown to the ancients. For ages the only representative of the rat family was the mouse. This mischievous little quadruped was the only representative of his kind which made any pretensions to domestic habits until long after the Christian era. His only enemies were man and the cat. Some time during the middle ages, an animal very similar in his habits to the mouse, made his appearance in Europe, from—nobody knows where. This was the *black rat*. This animal soon spread over Europe, and was carried by shipping to other portions of the world. The rat was unknown on this continent at the time of its discovery. No sooner did he appear in Europe than he immediately commenced a ferocious war upon the mouse, and soon fairly established himself in our dwellings in his stead. To this day the rat is as bitter an enemy to the mouse as is the cat to both. Its greater strength, ferocity and fecundity has enabled it to maintain its position.

The brown or Norway rat is quite a different animal still from the black rat, and more ferocious and destructive. This animal made its first appearance in Europe about the year 1700. It was brought in merchant vessels from India. No sooner did it gain a good footing than it commenced a war of extermination against the black, and they, in turn, are fast going the way of the mouse. The brown rat first appeared, in considerable numbers, in England in 1730; twenty years later, it made its appearance, in force, in France. When Buffon wrote his immortal work, not a specimen of the kind had been seen in Paris, although it was found along the seaboard of France. To-day, not a black rat can be found in Paris. The brown species has now entirely supplanted his less ferocious brother. The brown, unlike the black rat, takes kindly to the water, and will make its way up and down rivers, moving slowly along its banks, each generation proceeding a little farther up stream than its progenitor. There is a black variety of the brown rat which is sometimes met with, and not unfrequently mistakenaken for the black rat; but the black is fast disappearing from both Europe and America. What kind of vermin will succeed this third scourge is yet to be seen.

It is the brown or Norway rat that has become such a pest in California—having been brought hither, by sea, in 1849. The mouse was already a resident of the State. If we are not mistaken, there were no rats in Marysville, Placerville, Nevada, or any of our interior mountain towns, until 1851 or '52. If our recollection serves us right, the cloth houses of Nevada were full of *mice* in the summer of 1850, while no *rats* were to be seen there. We have a very distinct remembrance of being kept "awake o' nights" by their racing, in legions, back and forth on the cloth lining of our lodging room, overhead.

Rats are sometimes voracious wretches. We gave an account, last week, of their attack upon a hog, which they "slew and eat." They sometimes, in the lack of better food, attack wearing apparel, beds and bedding, and even leather. There are hamlets in Europe where tenants have actually been forced from their houses by these voracious and destructive animals. When they are numerous and on the increase, very few cats like to tackle them. We have repeatedly seen them hold their old and natural enemy at bay.

Ever and ever, since the dry land first appeared, has the sea been at its monotonous toil; ever and ever murmuring, surging, undermining, hurling down the earth, night and day toiling and laboring at work even in its placid moods; when, without a ruffle on its polished face, with gently heaving breast it idly chafes the pebbles of the shore.

## TRANSPARENCY OF RED-HOT METALS.—

The eminent Italian *savant*, Father Secchi, of Rome, lately communicated to the world what he considers a fact, that iron, steel, platinum and copper, are transparent when at a bright red heat. The manner in which this *savant* discovered this property in iron is as follows: He had ordered a strong iron tube to be made. As it was intended for an apparatus requiring a vacuum, it was essential the tube should be perfectly air tight; but having some doubts about it in this respect, and wishing to set them at rest, the tube was made red-hot and taken into a dark place, where Father Secchi distinctly perceived *through the iron*, which was half a centime thick, a crack inside the tube, and which did not reach the outer surface. The above facts are also attested to by A. Adriani in the *Chemical News*, who asserts that he has witnessed the same phenomena while working in an engineering establishment connected with a sugar refinery. The editor of the *News*, however, appends to the communication the following note: "The above statements are so much at variance with all previous ideas on the subject, that much stronger evidence will be required before the transparency of red or white-hot metals can be accepted as proved."

TO RENDER RESINS SOLUBLE.—Copal and other refractory resins are soluble in oil of turpentine, etc., if, after they have been kept heated for fifteen or twenty minutes to a temperature of 350° or 400°, of course in closed vessels. The best way of operating is to heat the resin for a few minutes in an open vessel; five or six per cent. of water are by this means expelled. The vessel may then be safely closed, and the heating continued. The product gives very excellent varnishes. To avoid the necessity of heating the varnishes so made, in order to lighten their luster, the oil, etc., which it is intended should be used, may be heated together with the resin. The product then simply requires dilution.

CURIOUS SCIENTIFIC FACT.—In the course of some remarks on the precipitation of silver, Mr. Carey Lea describes a curious fact in relation to the color of the deposited silver. He says: "A plate was covered with a considerable thickness of ammonia nitrate solution, to which was added a dilute solution of Rochelle salt. The plate was then placed in sunlight, and left for some time. Reduction took place, and evaporation, which went on simultaneously, had extended over about one-half the plate, when it was removed from the sunshine. It was then carefully washed. All that part of the metallic silver on which the solution had been suffered to dry in the sun was pure steel-grey, whilst that which was removed still wet had a strong reddish bloom." The contrast remained permanently, and evidently depended upon some difference of molecular arrangement. "It would be interesting to observe," says Mr. Lea, in connection with this, "whether negatives which are dried in the sun are not thereby somewhat different from the same or corresponding negatives dried in the shade; and, also, whether positive proofs on paper could not be affected for good or for evil by drying in the sun."

DEODORIZED NITRO-BENZOL.—Nitro-benzol may be obtained nearly colorless, entirely free from the unpleasant tarry smell which usually accompanies it, and in fact with a pure, fragrant odor, by distilling it, much below its boiling point, in a current of steam. The first portion of the distillate should be rejected.

ASBESTOS is found to make a superior base for the plates of artificial teeth. It is light, and is not affected by the acid secretions of the mouth. It is said to be far preferable to rubber. It is prepared in the form of a paste combined with other materials, and it adheres firmly to gold and aluminum plates.

A FRENCH chemist has proved, by a practical test, that fresh milk can be kept for almost any given period, perfectly sweet and good, simply by the complete exclusion of atmospheric air.

## New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## PATENTS RECENTLY ISSUED.

66,798.—COMBINED INSTRUMENT FOR WATCH-MAKER'S USE.—Charles E. Collins, San Francisco, Cal.:

I claim an improved instrument for watch-maker's use, formed by the combination of measuring gauges for watch-crystals, main-springs, and wheel-pinnions, a revolving bench-key, and a case-opener, all united and connected with one handle, substantially in the manner as herein described.

66,859.—GRAIN SEPARATOR.—A. W. Lockhart, Sacramento, Cal.:

I claim, 1st, Adjustably attaching the fans to the fan-shaft so that they may be set at any desired angle, substantially as herein shown and described.

2d, The combination of the fan-boards, D, jointed arms, C, C', and curved arms, E, or equivalent, with each other and with the fan-shaft, B, substantially as herein shown and described.

3d, The combination of the curved adjustable blast-boards, I and J, with the air-chamber, A, blast-chamber, K, and with the shoe of the machine, substantially as herein shown and described, and for the purpose set forth.

66,990.—HAY ELEVATOR.—William L. Oversher, Stockton, Cal.:

I claim the single rope, I, in combination with the pulleys, H and K, and the block, L, for the purpose of effecting the simultaneous motions of the forks, M, in opposite directions, substantially as described.

## RECENT INVENTIONS.

LEPURTANT IMPROVEMENT IN WEIGHING SCALES.—Mr. E. Simpson, (residence not given in the account before us), has recently devised a most important improvement in scales for the weighing of heavy articles, which is said to be unequalled by anything heretofore used for such purposes. First, is the platform scale. The levers are placed in the corners and are only nine inches long, and connected with short links and yokes, forming a series, along which the weight is transmitted. The friction caused by driving on the loads and the sudden jarring of heavy weights, are spent on the links, and not on the pivot edges; hence they will last an indefinite length of time.

Nothing surprises the spectator more than to see these scales weigh small weights. A pound, or a half pound, is indicated as unerringly as two, five or ten tons; and when any small weight is added or withdrawn from enormous ones, it is shown as quickly as on the grocer's counter scales in weighing tea or spice. So simple is the construction, that the pieces of scales to weigh ten tons can be packed in a box five feet long and one foot square.

This same invention is applicable to weighing canal boats, and one great advantage is, no other house is required than the small structure used for the weighmaster's office; thus saving \$5,000 or \$6,000 in the erection of a building, since it is built into the lock itself, and not suspended from above. So exact are these lock scales, that the taking out of a heavily loaded boat a couple of pails full of oats is indicated on the bar. These scales are in use on the Champlain Canal at Waterford, and at other places, and the State engineers and surveyors have testified to their excellence and economy. They are also in use on the Hudson River Railroad, and other roads, giving particular satisfaction from the fact that the passing of the cars over them produces no friction on the knife edge bearings. On a trial at Elmira, New York, where various very heavy articles were weighed, a watch belonging to one of committee turned the beam.

Finally, there is an automatic scale for weighing grain, which one cannot see without wonder. First, there is the bin for holding grain. At the bottom is a valve through which the grain runs into a hopper on the scales below. When the required amount—say 100 bushels—has descended, what is equivalent to the bar rises and closes the valve. By the same power a cog-wheel turns, and indicates on a clock-face the amount of grain weighed, and at the same time a valve in the bin opens, when the grain is discharge by a spout into cars or a vessel. Then the valve at the bottom of the hopper closes, when the valve in the bin opens again, and the process is repeated. All these various operations are performed by the weight of the grain alone, and the human hand is not required to lift a finger.

Thus all these various modifications of the invention show that they meet the new demands of the age.

IMPROVED STEERING APPARATUS.—A New York paper thus refers to a new steering apparatus in use upon some of the steamers of that port: It consists of an instrument with two dials, placed on the bridge, and each of these dials is connected by strong copper chains, one, the "transmitting dial," with another dial in the wheelhouse in which the orders "Port," "Starboard," or "Steady" are revealed, a gong sounding at the same time to call the helmsman's attention to the order sent, while the other, the "reply-dial" is connected with the rudder head; although the distance between the bridge and wheelhouse is 198 feet, the orders are transmitted instantaneously, and as every movement of the rudder is registered upon the reply-dial, the officer on duty can see whether his orders are properly obeyed. This instrument is the invention of John S. Gisborne, is simple in its construction, and its operation being entirely mechanical, is not liable to get out of order. The committee appointed by Congress to examine life-saving inventions, have reported favorably upon this, as also have the New York Board of Underwriters.

A NEW MINING MACHINE.—The Idaho *World* speaks of a new mining machine which has recently been invented in that place by a miner named Emerson. The principle is described as follows: The sluice boxes lead to an endless revolving chain, to which strong metal scooping cups are fastened, similar in kind to the elevators in a flouring mill, which take the refuse dirt and deposit it in a sharp, sloping, great sluice box, which is rigged to move from side to side, so as to equalize the dumping heaps. A Chinese wheel drives the endless chain, and the water from the wheel is thrown back, as its force is used, into the sluice boxes, thus effecting an economy in water. We heard some miners who had given the model a close examination express rather favorable opinions of it.

An improved knitting machine has recently been invented in New England, which, it is claimed, will knit fifty pairs of stockings in a day, and is so simple that a child can work it.

THE PACIFIC RAILROAD GEOLOGICAL SURVEY.—The Government geological survey of the Pacific Railroad route through Nevada, Utah and Colorado, has commenced, and the corps has been pursuing its labors in the vicinity of Pyramid Lake, extending its explorations as far as the Black Rock region and some of the Humboldt districts. It is under the direction of King, of the Engineering Bureau, and consists of twelve scientific assistants, ten laborers, and a small escort of soldiers. The Virginia *Enterprise* says:

In a few weeks, King will locate his headquarters in Virginia, and devote the winter months to the examination of the Comstock lode. The plan of the expedition embraces a geological, mineralogical, topographical, botanical—in short, a thorough scientific survey of a belt of about seventy-five miles on either side of the great national highway, extending from the Sierra Nevada to the eastern base of the Rocky Mountains. Fortunately for us, the most important regions of Nevada are included in its range, and our State will gratuitously reap the benefit of a more complete exploration than it could ever hope to procure by its own means. The survey is being conducted under the direction of the Engineering Bureau of the War Department, and six years are allowed for the completion of the work; considering which circumstances and the eminent scientific abilities of the gentlemen to whom the Government entrusts the execution of such projects, it is but reasonable to suppose that the survey will be performed with that thoroughness which has characterized every similar undertaking of the Government.

NEW INCORPORATIONS.—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

JOURNEYMEN BOOT AND SHOE MANUFACTURERS COOPERATIVE UNION.—San Francisco, Aug. 21. Capital stock, \$50,000, with right to increase to \$100,000; 1,000 shares, \$50 each. Trustees: William F. Meagher, Elliott Wescott, Albert B. Pingstone and Benjamin F. Mains.

BAY VIEW PARK HOMESTEAD ASSOCIATION. San Francisco, Aug. 19. Capital stock, \$500,000. Trustees: Henry A. Crane, Wm. H. Bryan, Arthur R. Street, Henry O. Howard, Joseph DeForest, Wm. A. Woodward and Silas Selleck.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,  
August 24, 1867.

## City Stocks.

City stocks, for the most part, are inactive, but the sales generally show a considerable advance over our previous quotations. Spring Valley Water Co. is in better request, selling at \$69@70 per share, then at \$68 50, and at the close \$69 is asked. California Steam Nav. Co. is also in better favor, twenty shares realizing 72½ cent, seller 30. San Francisco Gas Co. also shows an improvement, selling at \$64 50; at the close \$64 is bid. A considerable amount of Fireman's Fund Insurance stock changed hands on the street at 91 cent, or \$9 10 per share. This company recently availed itself of the provision in its by-laws relative to marine insurance, and since the first instant they have been prepared to take risks upon this class of property in addition to their regular fire insurance business.

Considerable sales of Legal Tender Notes were made during the past week at 72@72½ c.

We refer our readers to the third page of this circular for full quotations of city and miscellaneous stocks.

## Mining Share Market.

The mining share market has been quite sensitive during the past week, developing a general disposition to make optional purchases, and this at all times has a tendency to produce less firmness; however, most descriptions continue to be well maintained, and the extended sessions of the Board show a largely increased volume of transactions.

CROWN POINT—continues to manifest considerable activity under fluctuating prices, opening at \$1,300@1,350, falling to \$1,150, rising to \$1,340, then dropping to \$1,160, and closing at \$1,243. Early in the period under review, in going east from the winze sunk from the 600-foot level, three and a half feet of pay ore were found, and including the developments in the winze, opened an ore body five feet wide. A late dispatch says the winze is fifty feet in depth and shows some improvement. The south drift from this winze, now about fifteen feet from the east drift on the 600-foot level, is said to be improving. The mine yields the usual quantity of ore, the average assays showing as good a quality as formerly reported.

CHOLLAR-POTOSI—was the feature of the week in stock circles, nearly 1,500 shares changing hands under the regular transactions of the Board, rapidly rising from \$340 to \$442 50, receding to \$410, rallying to \$430, then dropping to \$395, improving to \$427 50, and closing yesterday at \$429. During the week ending August 15th, 2,200 tons of ore were sent to custom mills, showing an average assay value of \$50 per ton. The rapid appreciation of this stock early in the week was due to the finding of ore in the new shaft at a depth of 860 feet, this being the greatest depth at which ore has yet been found on the Comstock Lode. On the 20th inst. this deposit was ascertained to be three feet thick, and reported to be of good quality, but later telegraphic advices proved less encouraging, and had the effect to depress the stock considerably for the moment; however, we have still later information which is of a more encouraging nature, assays of the ore found at the bottom of the shaft showing a yield of over \$65 per ton.

SAVAGE—has attracted considerable attention this week and is in better request, opening at \$218, improving to \$224, and selling yesterday at \$223. We learn that the ore at the north end of the seventh level is still over sixty feet wide, and continues to be of a fine quality. The north drift from the third station is said to be improving, giving great confidence as to the future productiveness of this portion of the mine; in fact, well informed parties express the opinion that this level will largely exceed the product of the one immediately above. The fourth station drift is 110 feet from the shaft, running in hard rock, and the E street shaft has attained a depth of forty feet below the fourth station. During the week ending August 17th 2,210 tons of ore were taken from the mine, showing an estimated value of \$94,996, or \$43 per ton; in the previous week the yield from 2,012 tons was equal to \$41 22 per ton. The north and middle mines of the seventh level produced 1,884 tons.

KENTUCK—has been less firm under more restricted transactions, declining from \$360 to

\$320, advancing to \$366, then selling at \$348@345, and closing at \$357. The developments on the 550-foot level, mentioned in our last issue, have widened to twenty feet, and are stated to look well. The placing of a new reel will not interfere with the raising of ore, if they so desire, since they have the privilege of hoisting through the Yellow Jacket shaft; however, the supply at the dumps is said to be sufficient for the present month.

YELLOW JACKET—sold at exceedingly fluctuating rates, improving from \$930 to \$1,025, falling to \$890, advancing to \$965, receding to \$905, and closing at \$920. The meagre information at hand regarding this mine is not of an unfavorable nature, and it is pretty evident that "hear" operations contribute largely to the present depression.

OVERMAN—declined from \$92 50@77 50, and closed at \$78. Encouraging news continues to be received at the office of this company concerning the future prospects of the mine. The receipts of hullion during the current month to date, including shipments advised by telegraph, aggregate about \$10,000.

EMPIRE—has been quiet; small sales transpiring at \$170. The actual receipts of this company in July amounted to \$26,230 30. The mining operations are confined to the upper works, from which they are obtaining a large amount of low grade ores, the revenue from the sale of the same being very considerable. The amount reduced at the mill shows an average yield of \$22 to the ton.

GOLD HILL QUARTZ—is in better favor, mostly selling at \$130 per share. Seventy-seven tons of ore reduced during the week ending August 19th yielded \$2,936 in hullion, which is a very material improvement over the previous receipts in the present month.

CONFIDENCE—advanced from \$70 to \$87 50, and at the close sold at \$90. The west drift, on the third level, was 345 feet from the shaft on the 20th inst., and with the exception of a small mixture of clay and quartz, shows very little change. The present yield of ore is considerable. Late advices state that in all probability the Winters' ground will be reached in the course of a week.

IMPERIAL—advanced from \$135 to \$145, then sold at \$140 buyer 30, and closed at \$136. The Robinson suit, which was decided against this company in the lower courts of Nevada—contrary to all expectations—involved the sum of \$150,000; however, counsel are confident the decision will be reversed before the Supreme Court.

SIERRA NEVADA—has been less active this week, improving from \$36 to \$44, declining to \$35, and closing at \$35. A recent telegram says the mine is now clear of water, and work has been commenced in the several drifts.

GOULD & CURRY—was in the market to a limited extent, selling at \$630@580 per foot. We have nothing new regarding this mine..... OPHIR has also been inactive, steadily declining from \$102 50 to \$85, and closing yesterday at \$85. The sinking of the new shaft will soon be commenced.

ALPHA—two feet sold at \$450. We can learn nothing about this claim..... BELCHER realized \$220@195..... BULLION sold at \$35@30, closing at \$31.

DANEY—was sold to a limited extent at \$20 per foot..... SEGREGATED BELCHER at \$8@6..... JUSTIS AND INDEPENDENT at \$21@13, then at \$10, closing yesterday at \$20.

EXCHEQUER—at the close, sold at \$11 per share..... Twenty shares AMERICAN COMPANY at \$5@4.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,855,331.

ESTABLISHED [ ] (MAY, 1860.)

VOLUME FIFTEEN

—OF THE—

Mining and Scientific Press,

COMMENCING JULY, 1867.

DEWEY & CO., Publishers.

Issued every SATURDAY, at our Book and Job Printing Office, 505 1/2 Clay street, corner of Sansome, San Francisco.

Terms in Advance—One year, \$5; Six months, \$3; Single copies, 15 cents; Monthly Series, \$5 50 per year, or 65 cents per number. Back Volumes from January, 1864, \$3 per volume; bound, \$5 per volume.

THE MINING AND SCIENTIFIC PRESS is now thoroughly established, and enjoys one of the largest and most permanent subscription lists of any weekly journal on this coast. The individual character and reputation of its constant patrons throughout the entire coast is one of the best recommendations of its merits and value as a medium of intelligent progress and prosperity.

DEWEY & CO., Proprietors.

Mining and Scientific Press Patent Agency, Newspaper, Book and Job Printing Office, 505 1/2 Clay street, San Francisco.

MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.)

Comprising the Names of Companies, District or County of Location; Amount and Date of Assessments; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Table with columns: NAME, LOCATION, AMOUNT, AND DATE OF ASSESSMENT, DAY OF DELINQUENT SALE, DAY OF MEETING. Lists various mining companies and their financial details.

Latest Stock Prices Bid and Asked.

Table with columns: STOCK, PRICE. Lists various stocks and their current market prices.

Table with columns: COMPANY, PRICE. Lists various companies and their stock prices.

Table with columns: STOCK, PRICE. Lists various stocks and their current market prices.

San Francisco Market Rates.

Table with columns: COMMODITY, PRICE. Lists various commodities and their market rates.

Table with columns: COMMODITY, PRICE. Lists various commodities and their market rates.

San Francisco Metal Market.

Table with columns: COMMODITY, PRICE. Lists various metals and their market rates.

To Those Whose Interests We Represent.

While there is every reason for gratification at the circulation which this journal has already reached, we are yet well aware that there are great numbers of miners, mechanics and lovers of science to whom it might be made a source of much usefulness and profit.

We trust that it is needless to urge upon our readers the necessity of promptly renewing their subscriptions. The two indexes for volumes XII and XIII, which we have already published, and the 500 ample pages of reading matter, apart from advertisements, to say nothing of our numerous engravings and illustrations, speak more for the value which we give for the price of a year's subscription than we can say in this connection.

National Mineral Land Law, Instructions. Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the United States Registers and Receivers and Surveyors General.

AN INSTRUCTIVE BOOK.

Prof. LAYRES' ELEMENTS OF COMPOSITION.

BELES-LETTRES AND ORATORY. For Scholars, Teachers, Lawyers, all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, \$1.10. This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive.

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value. I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.

RECOMMENDATIONS:

After a careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival, I regard your work as the best of its kind. I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages of conciseness, simplicity, and of such simplicity it is arranged as to be readily understood by the advanced pupil.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

Table with columns: BOOK TITLE, PRICE. Lists various books on mining, mineralogy, geology, and metallurgy with their respective prices.

One copy, six months, in advance, 3 00  
For sale by Carriers and Newsdealers.

WRITERS should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Dr. J. G. Yates is our duly authorized travelling agent, July 6, 1867.

Mr. A. B. Butler is a duly authorized travelling agent for this paper. July 15, 1867.

Mr. Alfred H. Nahor, is our duly authorized traveling agent for Amador and El Dorado counties. July '83.

Mr. W. D. Root is an authorized agent for this paper for Nevada State. August 1, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

## San Francisco:

Saturday Morning, Aug. 24, 1867.

## Notices to Correspondents.

ENGINEER.—Of the great railway constructions lately erected, and second probably only to the St. Lawrence bridge (one wholly completed by this time), is the great railway bridge at Runcorn across the river Mersey, a few miles above Liverpool, England. The following figures will best give an idea of this extraordinary undertaking: The total length of the structure, including the slopes on either side of the river (there being 65 arches on the Lancashire and 32 on the Cheshire side of the river), is a mile and a half. The river will be traversed by means of a huge iron bridge consisting of three "stretches" of wrought iron girders, resting on two stone piers rising from the bed of the river, and two on the margins at either side. Each of these "stretches" measures 305 feet, the height above the water at spring tides being 75 feet to the under edge of the girders, and 78 feet 6 inches to the surface of the rails. The framework of the bridge proper consists of four iron beams, which extend the whole length of the span, the outer beams being strengthened on both sides by a trellis work 40 feet in depth, which, while helping to bind the structure, gives to the huge mass a comparatively light and airy appearance. Of the arches which form the remainder of the viaduct, 88 have each a span of 40 feet, and 9 of 61 feet 6 inches. The total cost of the viaduct and bridge will probably exceed \$1,500,000, while the result will be a shortening of the distance between Liverpool and London of about a dozen miles. The cyclo-pian character of the work, and the rapidity with which it was executed may be conceived, when it is mentioned that in merely one of the chief girders, nearly two million pounds of iron were used, which enormous weight was wrought and fastened into its proper form, and fixed in its permanent position within eleven weeks.

MASON.—The generally accepted theory of the hardening of mortar is, that it is due to absorption of carbonic acid from the atmosphere, thus forming carbonate of lime. This, however, does not account for all the phenomena, for much of the lime for ages still remains in a hydrated form. In this condition Dr. Malcolmson found a large quantity, even from mortar which was extracted from the great Egyptian pyramids. All old mortar, when treated with an acid, yields a small proportion of gelatinous silica, clearly establishing the fact that one of the hardening properties of ordinary mortar consists in the formation of a hydrated silicate of lime, which is the chief substance that influences the rapidity with which mortar hardens, as is well seen in those cements called hydraulic, from their rapidly hardening under water.

The employes of the firm of Harpers have united with those of another New York house in establishing a cooperative grocery store.

## Rates of Interest in San Francisco and London.

The value of money in London and New York, as compared with its value in San Francisco, presents a most important theme for reflection. The current rate of interest in London is quoted at  $2\frac{1}{2}$  per cent. per annum, and at latest dates there was a prospect that it would fall even lower still. In New York, money can readily be had for five per cent. per annum; but in San Francisco, the lowest rates for large sums, even, is ten per cent., and from that to fifteen per cent. To borrow money here, even at the high rate quoted, the security must be undoubted. In the mountains, if to be had at all, money commands a still higher rate than in this city.

Thus it will be seen that gold, unlike all other productions, possesses less value the further we are from the source of supply. Although this fact is not new, since it has frequently been noticed by writers upon political economy, and laid down as a law; yet we confess our inability to fully appreciate or explain the same.

Why is it that in California, a State possessing innumerable resources, so many of them should languish for the want of capital; while that very capital, so much needed here, goes abroad, and is content with investment at perhaps one-fifth the rate it will command here? Surely such a state of things cannot be natural.

There is not a civilized community in the wide world that doubts for a moment the permanence and continued growth of our commercial and real estate interests, on which surety for capital is chiefly based. The future of San Francisco is brighter and surer to-day than the future of either New York or London. There is only one solution for this enigma—the lack of confidence—not in our growth, nor in the future value of our securities, but lack of confidence in the integrity of our people. The admission may be humiliating—it may be unjust. It is unjust to our people as a whole; but it is God's truth, and the plain practical question with which we have to grapple is, "What can be done to inspire confidence abroad?" The fact should be admitted, however undeserving, and the question should be met.

The information afforded by Mr. J. Ross Browne, in his forthcoming reports, may accomplish much in this direction. Cannot some of our correspondents also suggest something which will aid in effecting the object in view? What can we do to inspire confidence in us among capitalists in London, who have more money than they need, and are looking abroad for investment?

We want capital, to the end that we may provide profitable employment for the starving millions of Europe, who are looking, with anxious eyes, to these golden shores. As things now are, it is a wrong thing to hold out inducements to European emigration, unless those emigrants can bring a sufficient amount of capital with them to make business for themselves when they arrive on our shores.

A few of our earnest men are at work in the work in the right direction, and are holding out inducements, to a limited extent, promising employment to such as will come with a little means. The capitalist will, either directly or indirectly, advance, say \$500 of his money against \$500 of the emigrant's for the purchase and cultivation of land—and well they may do it. There is no possibility of loss in such an undertaking; but we want manufacturing industries, to furnish a market for the produce of the farmer. For that we need the capital, and must have it at a rate of interest at least approximating to that at which it can be had for employment at home; otherwise we cannot compete with the importer. Let us settle this question of personal confidence, and it will flow in to us in larger abundance than that in which it now passes out of the Golden Gate, for investment abroad, or to purchase that which we should produce at home.

## A New Sulphuret Process.

A correspondent of the *Atta* recently wrote from Sutter Creek as follows with regard to what appears to be a new process for treating sulphurets:

Nothing that I have seen in my trip has interested me more than the sulphuret works twelve miles east of Jackson. Here sulphurets are purchased, and are worked by a process known only to the proprietor, a German, named Thoss. Sulphurets are reduced elsewhere by chlorination, at a cost of about \$25 per ton, but all the silver is lost, and roasting is necessary as a preliminary; whereas Thoss does not roast, saves all the silver, and says he can catch ninety per cent. of the gold at a cost of eight dollars per ton. I look with suspicion at all new and secret processes, and I inquired of intelligent miners at Sutter Creek, Volcano and Pine Grove, who have had business with this sulphuret mill, and all spoke well of it. Mr. McLane, of the Sirocco mine, said he paid \$80 per ton for working sulphurets, and had received a return of \$240 per ton. No one seems to have any idea of the nature of the process. The sulphurets are ground in an arastra, which anybody can use, and are then discharged into a small, close, dark chamber beneath, to which nobody, save the proprietor, has access. Much of the ore near Pine Grove and Volcano is very rich in sulphurets; so there is abundant business there for a mill of this kind.

Faith in chlorination is, however, not extinct. The largest chlorination works in the State have lately been erected by Coney & Bigelow (the latter of Bigelow & Bros., San Francisco,) at Jackson. Their mine would not pay to work for free gold, but is very rich in sulphurets, yielding five per cent. of them, with \$200 per ton. The furnace has a capacity to roast three tons in twenty-four hours. There are two hearths, one over the other, and a ton and a half is kept in each hearth. After roasting twelve hours, the lower hearth is discharged, the contents of the upper are let down to the lower, and the upper receives a new charge, and so on. The chlorination works, under charge of John Agrell, Esq., had just started when I was in Jackson.

The proper working of sulphurets is now the great question of the day, both for gold and silver. It is more than probable that Mr. Thoss, above alluded to, is in possession of a valuable secret for the better and cheaper treatment of valuable sulphurets. It is not at all remarkable, however, that he is able to save the silver as well as the gold, as that may be readily done at any sulphuret works by a slight modification of the process generally in use; the cost is the only thing in the way.

There is a gentleman in this city, of undoubted scientific attainments, and who is a practical as well as scientific miner, who has repeatedly assured us that he is in possession of a process for working silver ores quite different from anything else in use, and which will reduce the cost of the present system fully one-half, and increase its percentage of yield more than thirty per cent. He has repeatedly offered to put his process to a practical test, and has several times been upon the point of accomplishing his desires; but has as often been bluffed off by some brainless pretender, whose oily tongue has been more powerful with the mine owners than the less smoothly spoken and less pretentious gentleman of science. The gentleman in question still retains his secret, hoping that some lucky turn of fortune may yet place him in a position to prove the value of his discovery at his own cost—in which case, as a matter of course, it will also be to his own profit.

The miners on this coast have no reason to doubt that, with all our present success, even, the working of sulphurets and refractory ores will, ere long, be greatly simplified and reduced in cost. Have patience; all will yet be well. We have sulphurets in abundance; they are the natural ores of gold and silver—the form which they most generally take on in the beginning; nearly every other description of ore being derived therefrom. The question of their profitable reduction is simply a matter of time, and will soon be solved.

## New Books.

CONFUCIUS AND THE CHINESE CLASSICS; OR Readings in Chinese Literature. Edited and compiled by Rev. A. W. Loomis: A. Roman & Co., San Francisco.

The Chinese are a mysterious people—numerous, but little known; ancient, but occupying only a small space in history. Hitherto they have been chiefly known by their singularities; but recent events having broken down their exclusiveness, the leading nations of the earth are now vying with each other in the cultivation of intimate commercial relations with that people. San Francisco occupies a geographical position, which gives her great advantages over all other cities in this enterprise. Hence it behooves us to become better acquainted with the history, institutions and literature of this singular people.

It was with this end in view that Messrs. Roman & Co. undertook to secure the compilation and publication of a volume to present, in a concise and popular form, a brief insight into the social condition of the Chinese, and the progress which they have made in general philosophy and literature. They seem to have been peculiarly fortunate in the selection of a compiler for such a work. Mr. Loomis was for a long time engaged in mission work in China, has an intimate acquaintance with their language and literature, and has gathered and arranged the facts for his volume in a most judicious manner. The book opens with a brief history of that ancient empire, before the Christian era, and then passes to the life and teachings of its great philosopher, Confucius. It gives a brief exhibit of the learning of the Chinese, their ideas and practice of government, their modes of thought, and their mental and moral character. It brings the reader, as it were, into direct contact with the people of which he is reading.

The larger portion of the volume consists of extracts from the writings of Confucius, who was to China what Plato was to Greece. Selections are also given from various other celebrated Chinese writers and teachers.

The compiler remarks that "Confucius taught much that our own people might find a useful study." He also gives a most encouraging account of the present social and intellectual condition of the Chinese. They are represented as essentially a reading people. As an evidence, he says that a single native publishing house in Fouchow employs over 100 workmen, and has issued fully 1,000 different publications. They have a great veneration for instructive literature, and pay but little attention to that which amuses, such as works of fiction and poetry. Their public buildings and highways are everywhere embellished with marble slabs, on which are engraven scraps of history or maxims of economy and morality. These sentences are committed to memory by the youth, and retained through old age. Similar choice fragments of literature are also met with on household utensils, such as teacups, vases, fans, etc.

It may not be generally known that many of the little placards posted over the doors of Chinese dwellings in this State, and which are usually thought to be signs or something indicative of the traffic within, are often, in reality, such sentences and maxims as those alluded to above.

The work is one of much interest to the general reader, and is designed to accomplish a large amount of good, in doing away with the unjust and mischievous prejudices which so generally prevail in the minds of our people against the Chinese. The publishers have done a good service to the cause of literature and commercial progress, and have not failed to present the same in a neat and attractive form and excellent in typographical execution.

STORED.—Considerable wheat, says the *Independent*, has been stored in Stockton during the past week, on account of its not being properly cleaned.

Popular Lectures on Geology.

Popular Lectures on Geology, is the title of a very interesting work translated from the German of R. C. von Leonhard, Professor at the University of Heidelberg, by Rev. J. G. Morris, A. M., and edited by Prof. F. Hall, M. D., formerly Professor of Natural Philosophy at Middlebury, Vt., and afterwards Professor of Chemistry and Mineralogy at Washington College, Hartford, Conn. This work, though among the earliest efforts of the kind to popularize the science of mining and geology, is nevertheless one which can still be read with much interest and profit. The work is embellished with numerous engravings, illustrative of the principles of those kindred sciences. These engravings are well executed for the time of their production (1839). We are indebted to a lady relative of the deceased editor of the work for a copy of the same, which has already afforded us many valuable hints, and from which we still further extract and condense as follows:

"The art of mining and geology mutually support and illustrate each other. As the geologist is indebted to the labors and observations of the miner, for many important facts relative to the formation of the crust of the earth, so the miner must possess some degree of geological knowledge, if he desires to ascertain the presence of useful minerals in his district, such as ores, precious stones, coal, rock salt, etc. He who abandons the simple and correct way pointed out by geological experience, runs the risk of groping in conjecture and doubt, and this is of particular importance in mining, for it is an enterprise brilliant and full of promise, and at the same time expensive and often illnsory."

Speaking of the silver mines at Andreasberg, Germany, which have been celebrated for nearly 400 years, the author says:

"Ho who has some knowledge of chemical affinities, and of the composition of those heterogeneous mineral bodies, which are found united at Andreasberg, cannot but wonder at the complicated chemical action which is hereso mysteriously displayed. They will become still more interesting and intelligible when we subsequently treat of ores and other productions of mines. We shall then again be reminded of the important reciprocal relations between mining and geology. Without the art of mining, these phenomena would have remained undiscovered to geology; and by the further aid of geology we hope to receive still more satisfactory information respecting such facts. Yet there is many a problem in these dark laboratories of nature, which can by no means be so easily solved. The more we reflect on the wonderful combination of minerals so entirely different in their character, the more doubts and difficulties arise."

ICE IN DEEP MINES.

The main entrance to the pits at Dannemara, (Persberg) one of the oldest and most celebrated of the Swedish iron mines, is a natural opening or abyss, of so large a circumference as to require some fifteen minutes to walk around its mouth. A scaffold is erected out, so as to overhang this abyss, upon which the hoisting machinery is placed. The observer can look down into this frightful abyss upwards of 500 feet, to which point the light of day extends, and beyond which all is shrouded in darkness, save when feebly illuminated by the dim lights of the miners. One of the most remarkable facts connected with this mine, is the large quantity of ice which is always present there. Says our author:

"The deeper you go, the more the ice increases. And in order to remove it from the pits it must be raised up in buckets. At some places the ice is ninety feet thick; it forms real glaciers, which are never diminished by any change of external temperature. This fact, however, should not be regarded as contradictory to another, which will hereafter be illustrated, and which is, that pits become warmer, in proportion to their depth. The phenomenon at Persburg, as we shall see, can be explained on natural principles. When the visitor has reached the bottom, he is conducted by his guide into vaulted chambers, through immense regions of ice. Many of these vaults are so large that fifty men can conveniently work in them at the same time."

This occurrence of ice in deep mines is not an isolated field. Ice is found in the pits of Ehrenfriedensdorf, in Saxony. Leopold von Buch tells us that formerly, in Norway, mining was prosecuted above the region of eternal snow. Wood, for the timbering, could not be had there, and its want was supplied by filling up a drift with water and allowing it to freeze; passages were then cut through the ice as they were needed, the balance of the ice being left in lieu of wood for timbers. It is also well known that the ancient Peruvians obtained ores on the Cordilleras, in places elevated above the perpetual snow line.

The mines of Rauris, in upper Austria, lie entirely within the glacier region, and most of the shafts open in eternal ice, clear as crystal; the miners' huts are surrounded with ice. On what is known as Gold Mountain, one of the shafts is sunk 100 feet through pure glacier ice.

A gold mine in the deep valley of the Alps, near Saltzberg, is the highest in Europe, which is now worked. There are two tunnels near this mine entirely surrounded with glacier ice. The miners of this region undergo great hardships from exposure to cold, and to avalanches, which often sweep them to destruction while going to and fro to their work, or while reposing in their cabins on the hillsides.

It is stated by one authority that there is a locality deep within one of the iron mines of Dannemara, already noted, where the mass of ice is 120 yards thick.

LATEST FROM PAHRANAGAT.—We have had the pleasure, during the past week, of an interview with Mr. William Flemming, who has recently been appointed superintendent of the Alameda mines at Pahrana gat. Mr. F. informs us that the company's property is being gradually developed, and with most encouraging prospects of success. The new superintendent is somewhat reticent with regard to the past operations on the mine; but we should infer that a considerable amount of money has been expended there in rather an injudicious manner. Two reverberatory furnaces and a cupola have been erected, which are of but little value. The company has also a small mill on the ground, but not yet put up, which is far from being what it should be. The superintendent will defer putting up the mill for the present; but will continue the work of opening the mine and getting out ore. This company owns 400 feet on the "List lode," which is considered the richest vein in the district. It also owns a large amount of other ground. The company is located at Logan City. There are five different settlements in the Pahrana gat District, representing as many different centers of mining, viz: Logan Springs, Crescent City, Silver Cañon, Hiko and Crystal Springs. The three first named are not more than five miles apart, and are all about twelve miles from Hiko, the county seat. Crystal Springs, the latest settlement, is five miles beyond Hiko. The population of the district is from 300 to 400.

There are several parties engaged, with good prospects, in developing mines. Among them are Messrs. Eisland and Raymond, and Capt. Dahlgreen. The former represents a large amount of English capital. A purchase was recently made by this party, which required \$5,000 worth of government stamps. The County Clerk required \$5,000 more under the State law, before he would record. If the document goes on to the record, it will cost the parties \$10,000 for stamps alone. This company has a 10-stamp mill at Hiko; Mr. Ostrom is the superintendent.

The Crescent S. M. Co. (a New York company), have their mill so near completion, that they have started up and crushed a small lot of rock for a prospect. They have a 5-stamp mill for dry crushing, with double discharge, two Wheeler & Randall pans, and one settler, with two reverberatory furnaces for roasting. The company

has 200 feet next south of the Alameda Co. on the List lode, besides other good mining ground. J. A. Bidwell is the company's superintendent. He went East on last steamer on business for the company.

RAZOR STROP MAN.—In our wanderings about the city, we came across the workshop of Mr. T. B. Rodgers, the well known razor vender, who is seen with his large torchlight every Saturday evening on the corner of Montgomery and California streets. We found him as usual entertaining his customers with the superior merits of his wares, exhibiting scintillations of wit, no less sparkling than those struck from his steel, and as keen-edged as the well-tempered blade in his hand. Iron seemed to be cut with the same impunity as lead, to the astonishment of the bystanders and a number of mechanics who had brought their tools to be tempered. Mr. Rodgers has commenced the manufacture and tempering of razors, carving knives, and other articles of hardware and cutlery, at No. 108 Leidesdorff street. All who have been badly shaved from purchases elsewhere, would do well to give him a trial.

GOLDEN STATE POTTERY.—We have seen, during the past week, some specimens of stove lining, which appear to possess the right kind of ring, at the salesroom of Messrs. Lobree & Co., 516 Commercial street, manufactured at Antioch, Contra Costa county. In the midst of a varied assortment of stone and earthen ware on hand, we noticed a beautiful water tank, a miniature representation of a well constructed edifice, with pillars and arches in front, surmounted with a dome, resting on columnar supports, intended, we understand, for exhibition at the approaching fair in Sacramento.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

JACOB SNEW, Pioneer Photographer, 612 Clay street, north side, four doors above Montgomery, (late 315 Montgomery street.) takes all kinds of Photographs in the best style of the Art. He would invite especial attention to the new "Cabinet Photographs," which he is taking to perfection. 16v14f

Gold Bars, of whatever size, if well cast, assayed for two dollars, at A. P. MOLITOR'S Assay Office, 61 Commercial street, opposite United States Branch Mint. 16v14-3m

Brown's Filtering Heater.—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone.

One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to 5v14-1v AUSTIN A. WELLS, Agent.

The most Responsible and Liberal Company in the World! J. A. EATON & CO., Managers Pacific Branch, 502 Montgomery st. 20v14n9p SAN FRANCISCO.

Perry Davis' Vegetable Pain Killer.

A CERTAIN ANTIDOTE FOR POISON.—REV. T. Allen, writing from TAYOY, Burmah, says: "Within the past four years I have used and disposed of about five hundred bottles, but am now out. Please send me a fresh supply as soon as you can—say two hundred bottles. I dare not be without it myself, and there are endless calls for it, both by Burmahs and Karens. I always take it with me in the jungles and have frequent occasion to use it, both on myself and others. One night, while sleeping in an open Zayat, I was awoken by a most excruciating pain in my foot. On examination, I found I had been bitten by a centipede. I immediately applied the Pain Killer, and found instant relief. In less than an hour I was again asleep."

Rev. Mr. Hibbard, writing from Burmah to his father, says: "I have used Davis' Pain Killer for Coughs, Colds, Summer Complaints, Burns, and for the Sting of Scorpions, with uniform success. We always keep it where we can lay our hands on it in the dark, if need be." Sold by all Medicine Dealers everywhere. 5v15-1m

**Builders' Insurance Company—**  
OFFICE IN THE BUILDING OF THE CALIFORNIA SAVING BANK, California street, one door from Sansome street.  
FIRE AND MARINE INSURANCE. 16v14n9p

FOR GALLERY PHOTOGRAPHS, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos 25 and 27 Third street. Every picture warranted to give perfect satisfaction. 5v15qr B. F. HOWLAND, Artist.

Save Your Teeth.—Do not have them extracted without first consulting a good Dentist. The loss is irreparable, and, in many instances, unnecessary. DR. BEERS, corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with rose gold—thus restoring them to their original usefulness and beauty. Call and examine the work. Finest quality of artificial work also manufactured. 16v14-1f

H. J. BOOTH, GEO. W. PRESCOTT, IRVING M. SCOTT  
24x12 **H. J. BOOTH & CO.**

THE Muscatine (Iowa) Journal records the discovery of an ancient brick, supposed to have been made something more than ten centuries ago, on the bank of the Cedar river, near Lord's Ferry, four feet below the surface of the ground. Further investigations are to be made, in the hope of finding ancient ruins.

ARTIFICIAL PINE APPLES find a large sale in Paris. It is said that they are made of turnips saturated with a syrup that invests them with the exact flavor of pine apples. Most of the jellies, of whatever name, are apples flavored to simulate strawberries, pine apples, etc.

**TOWNE & BACON,**

**Old Boilers Repaired**  
**B. CAMERON.**  
6v12-1y

**COAL IN PAHRANAGAT.**—The Anstin Re-reille has received a sample of coal from Mr. Henry Raymond of Pahrana-gat, which is said to have been discovered about 15 miles from Hilo, the county seat of Lincoln. It is a good looking article of anthracite coal, and was found in a vein 15 inches thick on the surface. We had a piece burned in a muffle furnace, and it ignited readily and formed a bright glowing coal, leaving a residuum of less than three per cent. of ash. In appearance and gravity it resembles the best coal found upon the coast.

**PAPER FROM WOOD.**—There is a machine in operation in Paris, from Wurtemberg, for making paper from wood, which is said to be the most extensive apparatus in the whole Exposition. A tree, cut into convenient blocks, is put in at the top of the mountain of continuous and gradually descending rollers and grinders, and comes out quite rapidly at your feet in the shape of a fine, white, soft pulp, ready to be pressed into any form of paper desired.

LACOUR'S SARSAPARIPHERE BITTERS. Have so speedily grown in favor that their unrivalled sale has attracted remarks and criticisms of the trade.

LACOUR'S SARSAPARIPHERE BITTERS. They are the most efficient Blood Purifier, because they combine with the whole-some Sarsaparilla, which operates by cutaneous excretions.

Who Takes Them? The Old Man Takes them as a gentle stimulant and mild rejuvenator.

The Young Man Takes them to regulate his system, prevent disease, and stimulate to new life his overtasked body.

The Young Woman Takes them to secure regularity in her habits; to tint her cheeks with the bloom of health; to give a sparkle to her eyes, and sweetness to her breath.

The Husband Takes them to promote vitality, give strength to the body, peace to the mind, and with his health, wealth and comfort to all his family.

The Wife Takes them to invigorate and strengthen her system, and as an aid to nature in regulating her periodical sickness.

Everybody Takes Them! PRO BONO PUBLICO! 2v15-6m

Machinery.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw the pulp to the center, where it passes down and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metallic amalgam.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY, San Francisco.

\$85 for Hunter's Improved Concentrator.

The patentee is prepared to sell his Concentrators for the above price, and guarantees, when the machines are run according to directions, to give 20 per cent better results than from any Concentrator built on this Coast, and will refund the money if they will not perform what is claimed for them. Machines with copper plates, will cost \$10 extra. The machine can be seen in operation

At Booth & Co's Union Foundry, up stairs. Parties purchasing Concentrators will do well to examine before buying others of pretended merit. Persons desiring it can have a practical concentration made of tailings at any time, and prove the working of the machine.

FOR \$50.

HUNTER'S EUREKA AMALGAMATOR.

For sale, the right to build and use in mills. A working plan will be furnished each purchaser. Five machines can be seen in operation at the Eureka Mill, Grass Valley. The cost of the iron for the machine, without the iron-box, is about \$100. The box will answer for wood.

By reference to the Mining and Scientific Press of May 25th, a full description of the above Machines may be found. For particulars, send for Circulars, or address ANDREW HUNTER, Union Foundry, San Francisco.

BLAKE'S PATENT QUARTZ CRUSHER.

CAUTION!

The owners of the Patent for this valuable machine, in order to facilitate the protection of their rights against numerous infringers, procured, some time since, a reissue of the Patent, bearing date January 9th, 1866.

This Patent secures the exclusive right to employ in Stone-Breaking Machines Upright Convergent Jaws, actuated by a Revolving Shaft.

All persons who are violating the Patent by the unauthorized making, selling or using machines in which quartz or other materials are crushed between upright convergent jaws, actuated by a revolving shaft, are hereby warned that they are appropriating the property of others, and that they will be held responsible in law and in damages.

Several infringing machines are made and offered for sale in this city, upon which Patents have been obtained. Manufacturers, purchasers and users, are notified that such Patents do not authorize the use of the original invention, and that such machines cannot be used without incurring liability for damages.

BLAKE & TYLER, Agents for the Pacific Coast.

QUARTZ MINERS, MILLMEN,

And others contemplating the erection of Reduction Works, for either Gold or Silver Ores, your attention is called to a new, superior

First Class Mill,

In all respects, with Pans and Separators complete. The Mill is adapted for 20 or 40 Stamps.

Full particulars may be had by calling on Messrs. Palmer, Knox & Co., Golden State Foundry, or J. B. HITCHCOCK, Millwright, Russ House.

Steam Pumps,

Brodie's Patented Improvements

FOR THE TREATMENT OF Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this improved Machine for breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low terms: No. 1—Or 6 inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut, price, \$600

No. 2—Or 12 inch Crusher, capable of similarly putting through five to six tons per hour, price, \$850

No. 3—Or 18 inch Crusher, will in a similar manner crush from seven to eight tons per hour, price, \$1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The eccentric is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the lower is applied to the fixed jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to grade the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest work yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First Street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County: RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1866.

JAMES BRODIE, Esq., San Francisco. My Dear Sir: I feel much pleasure to inform you that I have for the past three months had one of your latest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which is entirely met my expectations, and I have no objection in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press, of Sept. 22d, 1866. BRODIE & MADCLIFF, Express Building, 402 Montgomery street, San Francisco.

LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALED IN THE United States or of the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc.

CALIFORNIA REFERENCES.—E. Stockton, Polson; O. Simmons, Oakland, (Mill at Clear Lake); Moran, Coville, Lexington, Santa Clara County; J. Y. McMillan, Lexington Santa Clara County. Send for Circular to KNAPP & GRANT, 310 Washington street, San Francisco.

Quartz Mill Construction and Superintendence

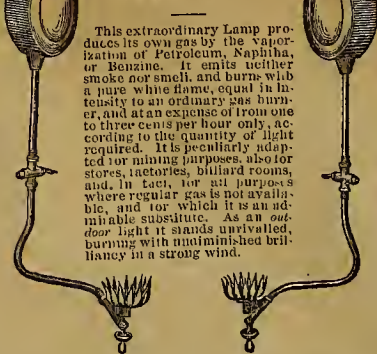

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a quartz Mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets, and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address M. M. SHAW, San Francisco, care Mining and Scientific Press. 25v13lm

Notice to Miners, Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee our anti-suction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done. M. PRAG, 8v13-ly Stove Store, No. 125 Clay street, below Davis.

Mechanical Drawings. Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

THE CELEBRATED Self Generating Portable Gas Lamp.

This extraordinary Lamp produces its own gas by the vaporization of Petroleum, Naphtha, or Benzine. It emits neither smoke nor smell, and burns with a pure white flame, equal in intensity to an ordinary gas burner, and at an expense of iron one to three cents per hour, according to the quantity of light required. It is peculiarly adapted for mining purposes, as directed for in the accompanying prospectus, Billiard rooms, and, in fact, for all purposes where regular gas is not available, and for which it is an admirable substitute. As an outdoor light it stands unrivaled, burning with unimpaired brilliancy in a strong wind.

Directions for Use. Charge the reservoir with the prepared fluid, or with Benzine, from half to three-fourths full; allow a portion to run through into the cup, then turn off the tap and ignite the fluid, which will heat the burner sufficiently to generate the gas, which will be seen issuing from the top. The tap must now be turned on, and a steady light will be maintained till the whole of the contents of the reservoir is consumed.

A small needle, bent at the point and fixed in a holder, may be occasionally required to clear the minute hole through which the gas issues, and the regulating screw at the bottom turned a little back; but care must be taken not to force the screw too high, and it should never be used to extinguish the light—by turning the tap off, it will gradually go out.

When necessary to renew the cotton which is placed in the lower pipe to prevent the too rapid flow of the fluid, the lamp should be placed in a vise and the burner screwed off. The burnt cotton must then be withdrawn, and a fresh piece of stout cotton rag, one inch wide and four or five inches long, should be doubled over a piece of wire, and inserted into the pipe—the ends cut short off, the burner again screwed on with a little white lead, and the lamp is ready for use.

Manufactured solely by JOHN J. HUGGS, original proprietor, Factory, North Beach, San Francisco; and for sale by his agents in every city and town throughout the State. 18v14-3n-3

E. O. HUNT, Manufacturer of Windmills, Horse-Powers, Pumps, Pumping Frames and Gearing.

HUNT'S ADJUSTABLE WIND MILLS to haul all the sails so arranged that they turn edgewise to the wind when the mill is stopped. The sails can be set at any angle to suit the force of the wind, while the mill is running, by means of the brake lever at the foot of the mill, by any person.

HUNT'S SELF REGULATING MILL is strong, durable and cheap. It is provided with means for stopping, in the most violent winds, and the mill is well known throughout the State.

Tread Horse-Powers, Swap Horse-Powers, Pumps in great variety, Single and Double Acting, Frames and Gearing for running pumps, from steam or other power, constantly on hand and built to order. Water Pumps built to order. No. 25 Second St., and 105 and 100 Jessie St. 2v15qy San Francisco.

PATTINSON'S HURDY-GURDY WATER-WHEEL.

The inventor of this Wheel having, after much delay, finally obtained the patent for the same, is prepared to sell rights therefor to such as may be desirous of putting them up, or continuing those already in use. This is well known among miners as the "hurdy-gurdy wheel," and is considered the most economical Water-Wheel now in use. Notice is hereby given, that the subscriber is the inventor and holds the patent right for the construction and use of the same; and that no person has a right to manufacture or use them without his permit. THOMAS PATTINSON. 7v15-qy

THE VITAL FLUID, OR ELIXIR OF LIFE.

A Frenchman, named M. Martin Ziegler, has recently obtained a patent, in France, for what he calls a "vital or organic fluid," which is collected, manifested and transmitted like the electric fluid. He claims that the use of this fluid, which is applied on the same principle as the electric fluid, is to rejuvenate the human system! He avers in his patent that, "Whenever azote and carbon are brought into contact, whether an azoted body and a carbonated body, or even a body strongly azoted and another which is only feebly azoted, there is disengaged an imponderable fluid, the presence of which is made known by particular effects on the organism of living things, animal or vegetable." He further says (which makes the matter as clear as mud): "If an acid or an alkali be made to act upon organic matter, a large quantity of vegetable or organic fluid is disengaged; also, that if the organic matter is devoid of azote, the disengagement of the fluid takes place, if an acid or an alkali be made to re-act upon a hydro-carburet, or even upon carbon." The grand secret of the astounding discovery is finally let out as follows: "A porous vessel or bladder is filled with caustic ammonia, and immersed up to the neck in molasses contained in an ordinary vessel. A silk thread is attached to the neck of the porous vessel, or bladder, and the end of a [another?] silk thread is placed in the molasses; the two ends of the silk thread being connected, the circuit is closed [established?], and the current of vital fluid passes. Its effect will become manifest on an organized being in the line of the current." The inventor further states that a number of these elements may be connected together, like the jars of an ordinary galvanic battery, to intensify the current. If our enthusiastic French inventor has made no mistake in his investigations, molasses and ammonia will hereafter be considered important agents in steadying the tottering steps and smoothing the wrinkled front of age!

A SCHOOL OF MINES IN MICHIGAN.—A School of Mines has recently been established in connection with the University of Michigan. The first class in this department graduates this summer. It consists of sixteen members. The Professor having charge of this department recently took the class out to see the mines in the Lake Superior region, in order that the pupils might have an opportunity to witness and familiarize themselves with a practical illustration of the theories which he had been laboring to engraft on their minds during their course of study in this interesting branch of education. The idea is a most excellent one, and will, no doubt, be followed up by each successive class in that department. Six of the party, says the Marquette Journal, from which we condense the above, remained for more extensive observations, and would return slowly, on their way back, as an exploring expedition down the coast. When shall we be able to chronicle a similar circumstance in connection with the "California School of Mines?" It is to be hoped no time will be lost by those having the matter in charge in maturing facilities for a thorough mining education on this coast.

MARBLE IN OREGON.—Mr. Gillette, correspondent of the Oregonian, writing from Ashland to that paper, says a Mr. Russell is manufacturing marble slabs from marble quarries in that vicinity. It is beautiful, and of peculiar formation, so that when polished it gleams like diamonds, like a mass of crystals cemented together.

STREAM vs. HAND LABOR.—A pound of cotton spun by hand can make a thread only one hundred and eight yards long; but when spun by steam, it will make a thread one hundred and sixty-seven yards long.

**DIAMONDS IN AMADOR.**—The Amador Dispatch says: Messrs. Phelps & Co. obtained from their mining claim, near Fiddletown, a diamond, some time since, which was found to be worth some \$54. Lately, we are informed that another has been found in the same claim, and it can now be seen at Mr. Ford's jewelry store in this place. Mr. Ford informs us that the substance in which these diamonds have been found is similar to that of the rich mining districts of South America.

**HEAVY SAWING.**—The Marysville Appeal has the following: The Oroville Record gives an account of some big sawing at a mill on the Susanville road, and asked "Who could beat it?" We are credibly informed, and can show the documents for it if necessary, that the Doon Lumber Company's old Clipper mill, in Butte county, cut last week in six days 116,159 feet of lumber—each day's work not exceeding 12 hours. And at no time during the season has the mill cut less than 101,000 feet per week.

**A New Ironclad** is being built for Prussia, in England, which, it is claimed, will be one of the finest vessel afloat. She is to be 305 feet in length, with a width of 60 feet, and will measure about 6,000 tons. She will be cased in iron eight inches thick, will have two inch turrets, each to carry two heavy guns, and will mount twenty guns on deck, of the heaviest caliber, protected by shields.

**SANTA CLARA COLLEGE, S. J. SANTA CLARA, CAL.**

Conducted by the Fathers of the Society of Jesus.

The SEVENTEENTH ANNUAL SESSION of this College will commence on August 24, 1887.

**TERMS**—Tuition in the Classical and Scientific Department, Boarding and Lodging, Washing and Mending of Articles Washed, School Stationery, Medical Attendance and Medicines, Fuel, Light, Baths, etc., per session of ten months, \$35.

For further information and catalogues, apply to the President of the College, or to Rev. A. Maraschi, St. Ignace College, Market street, San Francisco.

**HINKLE & CAPP'S CENTRIFUGAL ORE GRINDER AND AMALGAMATOR.**

Patent dated April 16th, 1867.

For Grinding and Amalgamating Charges of Ore.

Arranged as shown in the first engraving, the pan is adapted for grinding and amalgamating separate charges of ore of 800 lbs. each, doing its work rapidly, thoroughly and effectually.

This sectional engraving exhibits more clearly the arrangement and shape of the grinding parts of the machine. It, and the other engravings, will be more clearly understood by reference to the accompanying explanation.

Half Section or Top View.

**The Centrifugal Ore Grinder.**

This new GRINDER and AMALGAMATOR is extremely simple and compact in its construction. The principle availed of is entirely novel. The grinding is effected by perpendicular millers, pressed laterally by centrifugal force against perpendicular iron discs, fitted to the inner sides of the pan. It is to be run at a speed of from 60 to 80 revolutions per minute, according to the hardness of the rock to be crushed. The pressure upon every part of the grinding surfaces is direct and uniform, and they wear with straight and true faces from first to last, conforming also to the shape of the sides of the pan, so that the work performed with old millers and plates is as thorough and perfect as with new ones. The pulp enters readily between the millers and side discs, the pressure being light in front and heaviest at the heel of the miller, there is no strain upon any of the parts, and no liability to breakage or disarrangement, and no wear except that which is useful on the grinding surfaces. The work done is performed without jarring, jerking, straining or clogging, with extreme regularity and evenness, the pulp being of great and uniform fineness. It is not liable to be clogged, nor to be obstructed, stopped, impeded or broken, by coarse pieces of rock, pick points or iron, accidentally introduced with the crushed ore, as these can readily pass each miller separately, without interfering with or affecting the other millers, each of which is independent, or can rest upon the bottom below the millers, without inconvenience, as the arms play freely an inch above the bottom of the pan. It is more readily cleaned up than any other pan, as each miller can be lifted out separately by hand, and there is no necessity for lifting the revolving cone or driver, which is also easily turned, there being no friction when not in use, or rapid revolution. The bulk of the mercury is not ground up with the rock, but lies below the lower ends of the millers in a groove, and in another groove on the cover of the pan, where all the pulp and amalgam pass continually over it without cutting or carrying it away. The millers and side

For Grinding and Discharging Continuously.

Arranged as shown in the second engraving, all the interior grinding parts being the same as shown in first view, this pan is adapted for receiving and grinding and discharging continuously crushed quartz as first supplied by a five-stamp battery, with No. 4 or 5 screens. A "sluicer" or some similar contrivance, to carry off the clay, slime and surplus water, is to be placed between it and the battery.

EXPLANATION.—E, miller-hanger, F, miller plate or shoe, G, side disc, H, supporting lip, D, bearing surface, I, leader, X, which is counter-balance wear of miller plates, or shoes. Y, cover used in working charges of ore. The dark shade on the bottom of the pan represents one of the grooves for mercury.

discs are easily removed at any time, or when worn out, and an extra set of millers is furnished with each pan sold. It is also adapted for grinding cement, sulphurets, roasted ores, etc.

We claim all these advantages for our Pan, and that it will do more and better work, with less power, and less attention and manual labor, more rapidly and with less expense, than any other pan or miller made for the same purposes, and claimed to be of equal or greater capacity. We will sell them for use on condition that, if when fairly tried they fail to answer these promises, they may be returned.

For full description and illustration, see Mining and Scientific Press, June 15, 1887.

**Hinkle & Capp's Centrifugal Ore Grinder and Amalgamator**

May be seen in operation, and examined, at the European Metallurgical Works, on Bryant, between Third and Fourth streets, San Francisco, where all interested in mining and milling operations are invited to inspect it. Its weight, as arranged for continuous grinding and discharge, with extra set of six millers, is about 2,700 lbs.; or as arranged for grinding and amalgamating single charges of 800 lbs. of ore, also with extra set of millers, about 3,000 lbs. Price, as above, completely fitted and ready for use, either way, \$500 gold coin.

For further particulars, apply by letter to PHILIP HINKLE and CHARLES S. CAPP, No. 513 Clay street, below Montgomery, San Francisco, Cal., or personally to the above, or S. P. KIMBALL, Esq., at the European Metallurgical Works, on Bryant street, between Third and Fourth streets, or at the Miners' Foundry, First street, near Folsom, where they are manufactured.

Send for Circulars. PHILIP HINKLE, and CHARLES S. CAPP, Patentees, 513 Clay street, San Francisco. 2v14-1f

**Portable Steam Engines!**

"Hoadley's" and "Hittinger's" Make.

HOADLEY'S.

FOUR SIZES, 8, 10, 12, and 15-Horse Power.

HOADLEY'S.

3 to 40-Horse Power.

HITTINGER'S.

THREE SIZES, 5, 7, and 10-Horse Power

HITTINGER'S.

TWO SIZES, 5 and 7-Horse Power.

COMBINING THE MAXIMUM OF EFFICIENCY, DURABILITY, and Economy, with the Minimum of weight and price.

These Engines are favorably known, a large number being in use on this coast for hoisting, pumping, threshing, milling and winnowing purposes. Steam can be put up on these Engines in fifteen minutes after reaching the place of operation, and the time, expense of setting boilers, machinery, and "construction account" saved, (which is often the difference between the successful and unsuccessful prosecution of mining enterprises,) in fact, the portable principle is the pioneer's friend, and enables him to draw engines on their own wheels to his cabin floor, and plant on the outmost confines of civilization the saw and grist mill, and it has done and will do more to help subdue the continent than any other of the modern motors which are crowding society and normalizing the world. All sizes on hand from 3 to 30 horse power, with and without carriages. Also, Portable Saw and Grist Mills. For sale by TREADWELL & CO., 9v14-6m1p Corner of Front and Market streets.

It is the poor man's friend, and the best family physician. Full directions accompany each bottle. Price 50 cents and \$1 per bottle. For sale by all dealers in medicines. Sole Proprietors, A. McBOYLE & CO., Druggists and Chemists, 534 Sacramento street, opposite What Cheer House, San Francisco. 10v14-1y

**GOVERNMENT HOUSE,**

Corner of Sansome and Washington sts. SAN FRANCISCO, CAL.

THE STREET CARS PASS THIS HOUSE IN every direction every ten minutes. The rooms of the House are well furnished, large and airy, are let by the month, week or day, and are kept in superb order. There is a Restaurant attached for ladies and families, where persons can board for one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The "Assess contains, proportionally, a larger amount of mining advertisements than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage. 1v13-6m SANBORN & CO

Economy in Advertising.—THE MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than our rivals; the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The "Assess contains, proportionally, a larger amount of mining advertisements than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

**CASSIN'S BITTERS.**—The proprietors of these well known stomach bitters have recently been compelled to remove to more extensive quarters than have heretofore been sufficient to accommodate their business. These bitters are said to be prepared with pure California grape brandy, and are compounded only with the best and most efficacious herbs known—all mineral substances being carefully avoided. They are designed to strengthen and invigorate the system, are coming into very general use, and may be obtained from druggists and grocers generally.

From 65,000 to 100,000 persons daily visit the French Exposition.

**BUSINESS NOTICE.**—Mr. A. T. Dewey, of this journal, contemplates a visit of several months in the Atlantic States, a portion of which time he will spend in Washington, New York and Boston. Any of our Eastern friends who wish to communicate with him, for business or other purposes, will address their letters to "Westfield, Mass."

**MARKET STREET HOMESTEAD ASSOCIATION.**—J. S. Lutz, Secretary. Office, 305 Montgomery street, corner Pine, San Francisco. 2v15

**SECRETARYSHIP FOR MINING COMPANIES.**—A gentleman of education, ability and experience, is desirous of procuring a position as Secretary, or Assistant Secretary, in some good Mining Company. Has most unexceptionable references. Address "SECRETARY," at this office. 6v15f

**Mining and Scientific Press  
PATENT AGENCY.**

**DEWEY & CO.,**  
SOLICITORS OF  
**American and Foreign Patents,**  
505 Clay Street, corner Sansome,  
SAN FRANCISCO.

Patent Cases of every kind conducted. Attention given to Re-issues, Extensions, Interferences, Rejections, Appeals, etc., etc.

ASSIGNMENTS, POWERS OF ATTORNEY, AND LETTERS OF ADVICE CAREFULLY PREPARED.

ENGRAVINGS FINELY EXECUTED.

COPIES OF PATENT PAPERS,  
Issued by the United States or Foreign Countries, procured in the shortest time possible.

**FIRST  
Paint Manufactory  
IN CALIFORNIA.**

**EPES & E. H. R. ELLERY**  
Have the Patent Right for the Pacific Coast to manufacture, sell and use

**Ellery's Patent India Rubber Cement & Paint.**  
It is for all exposed surfaces; impervious to wet; will not rot, peel, blister or crack, in any climate. A superior Paint for brick, wood, cloth, metals, etc.; successfully used in the Eastern States. The old tin roof of that large building, the New York Rice Mills, was in such bad condition it was about to be taken off ten years since. Instead, they put on the INDIA RUBBER CEMENT AND PAINT, making a good tight roof. A coat of India Rubber Paint every two years since keeps it in good condition. We can refer to many others. The Atlantic Lead Works use our Paint only.  
**NEW CLOTH ROOFS** put on; copings and all seams cemented and saturated, then coated with the India Rubber Cement and Paint—the same as on the St. Nicholas Hotel at New York City, the City Buildings and many others, the roofs of all the horse and steam cars, docks of steamboats, etc., around New York for eight dollars per one hundred square feet. **NEW OR OLD TIN ROOFS** cemented and painted with the India Rubber Cement and Paint guaranteed, at from one cent to two and a half cents per square foot, according to size and condition of roof. Good men and the best materials used.  
We have just cemented and painted old tin roofs of Dr. H. D. Cogswell, Tubbs & Co., E. J. Oliver, etc., and the wood work of Sheriff Davis's building, 88 feet front on Folsom street, between Third and Fourth streets—only one coat. The work will speak for itself. Now painting the cornice and iron work of Dr. H. D. Cogswell's building, corner of Front and Clark streets—one coat. See the above and further references at our office.  
**ELLERY'S PATENT INDIA RUBBER CEMENT AND PAINT** is composed of India rubber and other gums, dissolved in linseed oil, mixed with the various coloring matters, and ground in any color. When applied to roofs or other purposes, it is mixed with pure linseed oil to the required thickness, and put on as other paints are, with a paint brush—retaining sufficient elasticity to give and take with the heat and cold. Fifteen hundred fishing vessels at Cape Ann use the India Rubber Paint, finding it superior to all others.

**EPES & E. H. R. ELLERY** are now prepared to make good roofs, and cement and paint new or old ones, and all kinds of outside painting with Ellery's Patent India Rubber Paint. No asphaltum or coal tar used.  
Office, No. 226 Jackson street, corner Battery, San Francisco, Cal. 6v15

**MINING COMPANIES**  
Can get their Printing done cheaper and better by  
**TRUESDELL, DEWEY & CO.,**

**Assayer and Chemist.**  
A GENTLEMAN WELL VERSED IN ASSAYING AND Analytical Chemistry, is desirous of securing a position in some assaying establishment, or would take charge of the assaying and amalgamating department of either a gold or silver mine. Steady employment, rather than high wages, is desirable. The advertiser would take his own laboratory to the mine if desired. Proper references given Inquire at this office. 5v15tr

To the Legal Voters of the City and County of San Francisco.

Prompted alike by a sense of duty to myself and to the public, and in compliance with the request of several hundred citizens, tax payers and friends of the Public Schools, representing the different political sentiments, religious creeds, nationalities and classes of the San Francisco community, I hereby announce myself an Independent Candidate, at the approaching election, for the office of Superintendent of Public Schools. In so doing, I deem it proper to say that I do not thereby appeal from the decision of any party or convention, but simply think it a matter of right, and, under existing circumstances, eminently fit to refer the subject of my candidacy directly to the people, the parties interested; and I think I may properly solicit, and with reason expect, the continued support of the friends of education, and that of all others who think I have faithfully and usefully discharged my duties during the past two years in the office to which I seek a reelection. I am induced to ask your support, and the more readily comply with the wishes of personal friends and the friends of Public Schools in becoming a candidate, since I am invited to do so "without respect to political considerations, which it is thought should be disregarded in the choice of school officers." Having devoted the best years of my life to the education of the young, and to the interests of this city and the State in that connection, I feel but just to myself and to the public which I have served, if success has attended my labors, that I should not be thrown out of a position of public usefulness and from needed employment, for no better reason than that another, however competent, wants my position, and seeks to be placed on it through preliminary political management and the discipline of a party organization. Such others as think with me in that respect, and believe a change of officers in the position I occupy is uncalled for at the present time, and that my reelection would subservise the interests of the Public School Department of this city, are respectfully requested to give utterance to that effect by casting their votes for me at the approaching election.  
Profoundly thankful for your generous support in a former election, I remain, respectfully,

**Pacific Mail Steamship Co's  
STEAMSHIPS FOR  
NEW YORK, JAPAN AND CHINA.**

**LEAVE FOLSOM STREET WEAR, AT 11 o'clock A. M.** of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers from ASPINWALL for NEW YORK.  
On the 10th, 18th and 30th of each month that has 30 days.  
On the 10th, 19th and 30th of each month that has 31 days.  
When the 10th, 19th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.  
Steamer leaving San Francisco on the 10th touches at Manzanillo. All touch at Acapulco.  
Departures of 18th or 19th connect with French Transatlantic Co.'s steamer for St. Nazaire, and English steamer for South America.  
Departure of 10th connects with English steamer for Southampton and South America, and P. R. R. Co's steamer for Central America.  
The following steamships will be dispatched on dates as given below:  
August 19th—SACRAMENTO.....Capt. J. M. Cavarly  
Connecting with HENRY HAUNCEY, Capt. Gray  
August 20th—MONTANA.....Capt. E. S. Farnsworth  
Connecting with ARIZONA, Capt. Maury.  
Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.  
An experienced Surgeon on board. Medicine and attend free.  
These steamers will positively sail at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.  
Through Tickets for Liverpool by the Cunard, Inman and National Steamship Lines, can be obtained at the office of the P. M. S. S. Co., San Francisco, where may also be obtained orders for passage from Liverpool or Southampton to San Francisco, either via New York or St. Thomas—if desired an amount of \$10 to \$20 will be advanced with the above orders. Holders of orders will be required to identify themselves to the Agents in England.  
For Merchandise and Freight for New York and way ports, apply to Messrs. WELLS, FARGO & CO.  
The Steamship GREAT REPUBLIC, Capt. S. Doane, will be dispatched September 3d, at noon, and will be followed by the CHINA, Capt. George H. Bradbury, October 14th, from wharf corner of First and Brannan streets, for YOKOHAMA and HONGKONG, connecting at Yokohama with the steamer CANTON, RICA, for SHANGHAI.  
For passage and all other information, apply at the Pacific Mail Steamship Co's office, corner of Sacramento and Leidesdorff streets.  
**OLIVER ELDRIDGE, Agent.**

**Favorable to Inventors.**—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the **MINING AND SCIENTIFIC PRESS**, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

### Gold in Old Stamp Heads, Etc.

EDITORS PRESS:—It is, I believe, but little known, that from the old iron, dies, shoes, etc., gathered in a quartz mill, a certain amount of gold may be taken out every year. In a mill of sixteen stamps, with the necessary amount of pans or Chili mills, etc., the savings of this kind may amount to from \$4,000 or \$5,000 every year if carefully collected and treated. The present process of working the iron seems to be to burn or roast it, and then work the gold out of it with the help of a knife or something similar to it. This is certainly a very slow process, and the object of my writing to you is chiefly to see if you could not recommend some other method cheaper, shorter and surer for the working of this iron, or rather the taking out from it of the gold it may and really does contain.

Brown's Valley, July 31, 1867. M.

We know of no better method than the one generally employed, as described by our correspondent. Is not the amount derived from that source, as named by our correspondent, rather large? There is a difference in the iron employed and in the manner in which the shoes of the stamps, and the shoes and dies of the pans are secured to their respective connections. Some iron is very porous—full of cavities, into which the fine amalgam will penetrate and pack very close. It is also extremely difficult to remove it from such cavities by the crevice process, and yet we see no other way to do it. When there are crevices or cracks in the iron, the iron should, of course, be opened or broken up. Shoes need never be cleaned, in the manner described, until they are ready to be thrown aside for remelting. If any of our correspondents can suggest any improvement in the manner of recovering the gold from old irons, etc., we should be pleased to hear from them.

WORK ON THE SEA WALL.—Mr. Houston, the contractor for the first sections of the sea wall, has commenced preparatory operations. He has purchased a dredging machine, and will begin work on the north side of Vallejo street and wharf, below Front street, and proceed thence northerly. The dredging will be the first process, and then the rock for the foundation will be thrown in. The material for this portion of the work will be excavated from a lot near the junction of Broadway and Sansome streets, but a few rods from the point where the work will commence.

### Westgate's Patent Sad-iron Heater.

We give herewith an illustration of another useful California invention, designed for the more economical and convenient heating of sad irons for ironing, than that which can be attained either from the ordinary mode of heating upon a common stove, or by any other special device hitherto offered to the public.

The nature of this invention consists in the employment of a furnace, with a sufficient number of holes in its top over which to place the irons; while the outer surface of the furnace is prevented from radiating its heat by an inner non-conducting packing, placed between the fire-brick lining

ironer to perform continuous work, in hot weather.

As a further improvement, the irons themselves are constructed in two parts, with a space between, which is filled with cement, by which the heat is prevented from radiating therefrom to the discomfort of the fingers of the ironer, while grasping the handle of the sad iron during work. The iron itself, by the same device, is enabled to retain its heat much longer than it otherwise would. The handles of the irons themselves are also thereby prevented from becoming heated.

This invention affords a great source, both of economy and comfort, in every household where it is introduced. As already

FIG. 1.

FIG. 2.

and walls of the furnace, by means of which the heat is prevented from escaping into the room, to warm up the same to an inconvenient degree, and at the same time to waste the heat given out by the fuel. To more effectually accomplish this end, both the top and walls of the furnace are made double, the interior being filled with the aforesaid non-conducting material.

Fig. 1 represents this furnace, or heater, standing independently, as it may, upon a table or elsewhere, so that an escape pipe may be connected with a stove or flue for carrying off the smoke and gases generated by the burning fuel. One iron is shown in place, for heating, while the depression in the top of the furnace is shown by its side, where another iron may also be placed for heating.

From fig. 2, it will be seen that the furnace is so constructed that it can be used on the top of an ordinary cooking-stove or range, without interfering with the cooking, as readily as any ordinary cooking utensil—the smoke passing downward into the stove. When not required for use, it can be easily set aside until wanted again.

It is claimed, and apparently with good reason, that this sad iron heater will save fully one-half the fuel required for heating irons with an ordinary stove or furnace, to say nothing of the great discomfort of an over-heated room, which is prevented by this apparatus, and which otherwise greatly interferes with the physical ability of the

stated, it is a California invention, and was patented in February last, through the MINING AND SCIENTIFIC PRESS PATENT AGENCY, by J. D. Westgate. Lock & Montague, of this city, are the agents.

WOMEN AS WATCHMAKERS.—Women have been found far more efficient in many delicate mechanical operations than men. Especially is this the case in watchmaking. Twenty thousand Swiss women earn a comfortable living by this business. They make the movements, and even mostly put them together. A few women are finishers. Geneva has refused to employ women, and totally lost the watch trade. None of the so-called Geneva watches are made there, but in Neuchâtel, where women have been employed.

A traveler says: We see women at the head of some of the heaviest manufactories of Switzerland and France in the watch and jewelry line. In England, women are employed in one London establishment, and in several others of the interior towns. We have already noted the fact that 500 are employed in one locality in making the delicate interior chains for chronometers.

American watches are made by machinery, instead of by hand work, which enables much work to be done in our establishments by men which is elsewhere done by women. Still a large number of women are employed in such work. The Waltham Company employ seventy-five. It is stated that the men, however, are more reliable, and do much more work in their particular departments. They are more thoughtful and attentive, more contriving and self-reliant.

### Death of Two Eminent Scientists.

Two eminent scientists have recently deceased. It is but a few weeks since we chronicled the death of Pelouze, of Paris; and now the telegraph has just announced the death of Faraday, of London.

THEOPHILE JULES PÉLOUZE died on the 31st day of May last, at the age of 60. He is known as the author of a great number of valuable treatises on various branches of applied chemistry, such as glass making, brick making, color and varnish making, washing and bleaching, etc., etc. His chief work is "On the Manufacture of Gas." So proficient was Pelouze as a chemist, in his youth, that the eminent Gay Lussac made him his assistant when he was but 20 years of age. Three years later he became Professor of Chemistry at Lille. He has published many of his researches, conjointly with Gay Lussac and Leibig.

MICHAEL FARADAY was born in London in 1794. He was the son of a smith, and received but little instruction in his youth. He was a self-made man, having commenced life as a book-binder. Sir Humphrey Davy early took him under his special care, and gave him that start which has since culminated in rendering his name famous among the scientists of the world. It is said that a friend of young Faraday, noticing his love for science, took him to Sir Humphrey and solicited a place for him as "bottle washer" in that gentleman's laboratory. Sir Humphrey received him kindly, was soon struck with his studiousness of character and aptness, and forthwith took him by the hand and assisted him heartily in the development of his latent genius. He soon became the friend and co-worker of that celebrated man, and has ever since been the only living, connecting link between the early and later schools of chemical science.

Mr. Faraday is the author of a large number of valuable works. He was eminent, both as a chemist, and as a natural philosopher. He is especially celebrated for his investigations into the principle of light and heat—electricity and magnetism being his specialties. His valuable services to England, and to the world generally, were appropriately recognized by his government, which in 1835 voted him an annuity of \$1,500. The Queen, in 1858, in consideration of his advanced age, and continued interest in behalf of science, and as a special personal mark of regard, allotted to him for the remainder of his life, a residence at Hampton Court, where he died. Thus has passed away his life of usefulness, honored in his old age, and his declining years, for which he himself never found time to make provision, were made smooth and happy by the generous acts of his country and his Queen.

IRON MINE SOLD.—The Oregonian says: "It is said that the St. Helen mine has passed into the hands of W. S. Ladd, Esq., of Portland, and Col. Hayward, of San Francisco."

QUITE AN interesting ceremony took place at Oakland on Saturday last, on occasion of the inauguration of the water works at the new college grounds near the bluffs.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

(Entered according to Act of Congress in the year 1856, by F. A. Herring, in the Clerk's Office of the District Court of the District of California.)

## Formation, Distribution and Age of Igneous Rocks.

(Continued from Page 98.)

In order to make the foregoing proposition appear plain, it will be found necessary to divide the stratified rocks into six periods or systems, and I shall assume their average thickness to be seven miles, and the entire thickness of the earth's crust to be seventy-two miles. Each of the six periods will be assumed to have continued during the formation of 7,000 feet of stratified rock. The first period will be called, for convenience, the Gneiss period; the second, Clay state; third, Silurian; fourth, old Red Sandstone; fifth, Carboniferous; sixth, the new Red Sandstone period. The sixth, or new red sandstone period, will include all the formation from the new red sandstone to the tertiary, and perhaps later. As we have assumed the whole thickness of the earth's crust to be seventy-two miles at the present time, it must have increased in thickness twelve miles, for, and including, every 7,000 feet of stratified rock deposited, and we will divide the igneous rocks into six periods, corresponding with the division of the stratified rocks. The great difference in the general appearance and chemical composition of igneous rocks, fully warrants such a division. Indeed, so greatly do they differ, that the aqueous rocks, to a great extent, receive their character from the igneous rock erupted synchronously with their formation. We have an illustration of this in gneiss, which so closely resembles granite that it is sometimes difficult to distinguish the line which divides them.

The rock erupted during the formation of the gneiss system was granite; of the clay slate, feldspathic granite; of the silurian, the magnesian rocks; of the old red sandstone, metalliferous quartz—and trachyte was the eruptive rock of the carboniferous and new red sandstone systems. Sodium was the predominating alkaline metal in the original granite, potassium predominates in feldspathic granite, and magnesium predominates in the eruptive rock of the third period. Calcium seems to have been present in the eruptive rock of all three periods. Lithium is found in mica, and barium and strontium probably existed in the original granite. The useful and noble metals predominate in quartz, the eruptive rock of the old red sandstone period. They are not, however, confined to the quartzose stratum, for traces of iron are found in some specimens of granite from above, and in trachyte from below, this stratum. I have in my possession a specimen of soapstone containing gold.

The more numerous the alloys and compounds, or ores of metals produced by an elevated temperature, the wider appears to be its zone. Trachyte probably contains no trace of the alkaline metals, and very little of any other metal, if we except aluminum, and is the most nearly indestructible of all rocks. It is not affected by ordinary or natural chemical action, and only seems to yield to mechanical action.

I will further assume, that of the supposed seventy-two miles in thickness of the earth's crust, but forty-eight miles is solid, and the remaining twenty-four miles is plastic. This last proposition might at first sight appear extravagant, but we will find, after giving the subject due consideration, that there is every probability that at one time in the earth's history, twenty-four miles in thickness might have been rendered plastic by loss of heat in advance of the solid crust.

Every fact in physical science points to the time when our globe was a self-luminous body, and like the sun, with its atmosphere filled with vapors of burning metals, its surface was once covered with volcanoes,

like the pores upon a huge animal, and the internal heat was so great that they remained constantly in action. At a later period, as the residual heat radiated into space, the volcanoes would become inactive over large portions of the surface, which might be covered to great depth with the condensed vapors of the burning metals and rocks. These "spots" might be rent assunder and dissipated, again and again, by the accumulating fires beneath, or they might, in process of time, increase to such size and remain for such a length of time that the atmosphere above them might become sufficiently cooled for aqueous vapor to condense and fall upon them. It is in the nature of things, that the transition from a self-luminous to an opaque body should be gradual, from isolated patches of crust, which were dissipated to reappear, repeatedly, until our globe became completely and permanently covered with solid crust, with only here and there an active volcano. The earlier stratified rocks were deposited under the peculiar conditions attending this transition state. First, a long continued and extensive shower of volcanic ashes, to be saturated and acted upon when the temperature would permit the condensation of aqueous vapor, by the water, which was strongly impregnated with hydrochloric and carbonic acids. The volume of water must have greatly increased, during the formation of the earlier stratified rocks, by the combination of hydrochloric acid with the oxide of sodium, the resulting compound being salt water.

It will appear quite certain that the granite upon which the gneiss system rests remained plastic during the formation of the estimated 14,000 feet represented by the gneiss and clay slate systems. If we admit this proposition, which, as we proceed, we will find it hears every mark of probability, we will be enabled to comprehend the plan of the distribution of igneous rocks. It is a well known fact that when silica is fused with an excess of the alkalis, soda or potash, it is rendered plastic and fusible at a low temperature, and also soluble in water. As has already been stated, it is fair to infer that the metals sodium and potassium, owing to their inferior specific gravity, originally existed the most abundantly at and near the surface, and in diminishing quantities at a greater depth. Now the sodium, which is the base of the salt in the ocean, and in the immense beds of rock salt hundreds of feet in thickness and covering hundreds of square miles, must have once existed in the original granite, which was thereby rendered fusible at a comparatively low temperature. Some kinds of glass are plastic, so as to admit of being worked at a low red heat—say 1,000° or 1,200° F.—yet pure silica is scarcely fused at 3,000°, and some ores require a temperature of 4,000° or 5,000° for their fusion. Now we will suppose the temperature of the surface rock to have been 1,000°, and that it contained sufficient of the alkalis to have rendered it plastic, and the temperature to have uniformly increased one degree for every sixty-six feet in depth. That would be an increase of 80° in one mile, 963° in twelve miles, and 1,920° in twenty-four miles. Thus it will be seen that by the gradual change in the composition of igneous rocks, from the surface downward, a constantly increasing temperature is required to fuse them, and it is not improbable that when the earth had sustained a loss of heat sufficient for the granite immediately underlying the gneiss to become solid, that the crust might also have been rendered plastic to the depth of twenty-four miles. Owing to a lack (on my part) of sufficient data, the above calculation is simply an approximation; and I would again urge the necessity of ascertaining the exact composition, specific gravity, ratio of expansion at an increased temperature, and also the temperature required to fuse all igneous rocks, in order that we may know the manner in which they are arranged or their position in the igneous part of the earth's crust. There can be no good reason why we should not know this with all the certainty the astronomer knows the distance, volume and specific gravity of the bodies belonging to our solar system.

[To be continued.]

**CRUELTY TO CATTLE.**—Cattle are taken through from Chicago to New York, without water, for the whole distance. The confinement and jar of the cars produces a feverish condition of the animals, which, apart from the natural sympathy for a brute, which ought to save him from such torture, renders his flesh unhealthy and unfit to eat. A reform is loudly called for. The meat of such animals must lay the foundation for numerous diseases.

(Written for the Mining and Scientific Press.)

## The Paris Exposition.

BY A. S. HALLIDIE.

(Continued from Page 93.)

## AN EXQUISITE CHIME OF BELLS.

There is an exquisite chime of bells which is occasionally heard giving forth beautiful sounds, that arrest the steps of most wanderers through the park of the Exposition. These sounds proceed from a peal of forty-three bells, set up on a large wooden frame under a shed. They were cast at the foundry of Messrs. Bollee et fils Maus. There is an exquisite melody in them, not jarred by the discordant clang occasionally heard in every peal of bells. They are intended for the Cathedral at Buffalo, and are arranged to be rung by means of suitable machinery. The drum which rings them is about 54 inches in diameter, 78 inches long, and has holes for about 6,000 pins, which act on levers, causing the bell hammers to strike. This drum is driven by a weight of 2,600 lbs. A large clock, intended for the same cathedral, strikes the hours on the same bells, the heaviest of which weighs about 5,500 lbs., and the smallest 40 lbs. They attract universal attention, for their exquisite tone and harmony; and it is a real enjoyment to listen to the airs played, among which, "*Partout pour la Lyric*," seems to be best appreciated.

Messrs. Finlander, of Moscow, and Ichneukoff, of Toula, exhibit, in the Russian department, a fine peal of elven bells, which are especially remarkable for the beauty of their ornamental casting, surpassing in elaborateness of design and fine finish of line, anything else on exhibition. Bourdou, of Lyons, also has some bells on exhibition, which show a most remarkable polish of surface, as if burnished in a lathe; the metal being very white, and having several beautiful figures cast on it in bas relief. The mystery is, how the smooth surfaces were obtained without some polishing tool being employed.

There are numerous other bells, among which are two of cast iron, 12 feet in diameter, and near by another one 9 feet large, but not otherwise attractive.

## A REMARKABLE CASTING.

Close by, and immediately under the bells, is a casting of twenty-two car wheels, 3 feet in diameter, cast in one piece, being side by side, a shaft or spindle having been cast connecting them all together. They are just as taken out of the sand, except the two end ones, which have been turned off in the lathe. The cast iron shaft has been centered and used to turn them on, as a mandril. The wheels give no evidence as to how they were cast, whether endways or sideways—and there is great dispute as to the method employed. There are no lines to show where the flasks were joined, and opinion seems to be divided among the visiting foundrymen, as to how these car wheels were cast.

## GRINDSTONES.

Some persons need sharpening up, and if one needs to grind any axes in this imperial exposition, L. Meyer & Co., of Savern (Bas Rhen), have kindly provided the means by furnishing grindstones of all grades of fineness and all dimensions, one of which is 12 feet in diameter by 11 inches thick, and which shows itself to be an excellent stone, free from inequalities and faults.

## STEAM PLOWS AND PLOWING.

Messrs. Fowler, of England, the great steam plowmen, exhibit, among other things, a "clip pulley," which they use in their steam plowing. Instead of the ordinary groove, there is at the periphery of the wheel, and close to each other, a series of clips, which work on a spindle or pin in such a manner that when the rope heds itself in the groove-shaped clips, it forces down the bed of the clips (there being two, opposite each other), and brings the sides together in such a manner as to grasp the

rope, while the shape of the clips do not allow of any injury to the rope. When the rope begins to approach the point where it leaves the pulley, it releases itself, and the clips open to their original position. The device is very simple and good; but like a good many simple things, can be more easily explained by a diagram. It is well adapted for the purpose of conveying power. Both the Messrs. Fowlers and Ransoms, of England, exhibit their different systems of steam plowing, either of which, it is claimed, is able to plow up hard, tough land, which could not be plowed in any other manner. These machines do all kinds of plowing, cheaper and better than by the ordinary mode of such work. The plan of the Messrs Fowler is to place the steam engine at one end of the field, and a pulley at the other; a steel wire rope runs across the field, being drawn by the engine by means of the clip pulley already described, and attached to which rope are the plows, in a gang of four—a double set—one set plowing across the field one way, and returning, (to do which the engine has to be reversed) this set is raised from the ground and the other set does the work. The plowing is done at a total cost of from \$1½ to \$2¼ per acre.

For large square fields, it seems as if this must be more economical than hand and horse plowing, although, in California, horses are cheap, yet labor is high, and it is important to have the plowing done early in the season, and rapidly. Moreover, the engine, when not plowing does other work, such as thrashing, etc., and does not need feed or churning when not at work.

## How Indians Make Arrow Heads.

There are probably but few, if any of our readers who have not, at some time, seen and admired the heads of Indian arrows, spears, javelins, etc., found in almost every part of this continent; and who has not often wondered how they could be so delicately and truly formed, by a people who were strangers to the use of iron? Similar articles are also found in various parts of the European continent. The Hon. Caleb Lyon, before his return trip to the East from this coast, casually met with a party of Shasta Indians, who still used these points, although with most of the tribes, at this day, they have been succeeded either with fire-arms or iron pointed weapons. Among the number he also found one Indian who could make them, and induced him to go through with the various stages of manufacture, which he did, and which Mr. L. subsequently described to the American Ethnological Society as follows:

The Shasta Indian seated himself upon the floor, and laying the stone anvil upon his knee, which was of compact talcose slate, with one blow of his agate chisel he separated the obsidian pebble into two parts, then giving another blow to the fractured side he split off a slab some fourth of an inch in thickness. Holding the piece against the anvil with the thumb and finger of the left hand, he commenced a series of continuous blows, every one of which chipped off fragments of the brittle substance. It gradually assumed the required shape. After finishing the base of the arrow head (the whole being only little over an inch in length), he began striking gentler blows, every one of which I expected would break it into pieces. Yet such was his application, his skill and dexterity, that in little over an hour he produced a perfect obsidian arrow's head.

I then requested him to carve me one from the remains of a broken porter bottle, which, after two failures, he succeeded in doing. He gave as a reason of his ill success, he did not understand the nature of the glass. No sculptor handled a chisel with greater precision, or more carefully measured the weight and effect of every blow, than this ingenious Indian, for even among them arrow-making is a distinct trade or profession, which many attempt, but in which few attain excellence. He understood the capacity of the material he wrought, and before striking the first blow, by surveying the pebble, he could judge of its availability as the sculptor judges of the perfectness of a block of Parian. In a moment, all that I had read upon this subject, written by learned and speculative antiquarians of the hardening of copper, for the working of flint axes, spears, chisels, and arrow heads, vanished before the simplest mechanical process. I felt that the world had been better served had they driven the pen less and the plow more.

**Mechanical.**

**Expansion and Contraction of Steel.**

Mechanics who have been employed setting up various kinds of work, requiring great nicety of fitting, etc., have often been much troubled with the greater or less expansion of the steel; so that such pieces of work which would fit exactly in a soft state, will not come together at all when hardened. It must also have come to the observation of many, that there is a great lack of uniformity in the amount of expansion—a piece of steel of the same size often expanding more at one time than at another; the proportion of expansion due to a given size is also found to vary greatly.

Every one knows that iron or steel expands by heating; but every one does not know that while iron generally comes back in cooling to its original dimensions, steel does not; but usually remains permanently increased in size. It may often help the workman in his labor if he thoroughly understands the philosophy of this change in size of the metal upon which he is working.

When steel is at a red heat, the natural positions of its particles are disturbed—placed further apart; if, when thus red hot, it be suddenly immersed in water, a more rapid change takes place in the outside particles, than in the inside. It is for this reason that large pieces of steel, so treated, do not properly harden to their centers. When the steel is immersed in the water, the outside crust, in cooling, gradually draws toward the center, and in so doing has to compress, by the strain, the inner portion of the mass. While the surface is thus cooled in a state of tension, with the center in a state of compression, the particles near the surface must necessarily be more or less removed from each other when cooled, and the whole mass, when fully cooled, will occupy more room than before it was heated. In other words, the expansion of the outer steel amounts to more than the compression of the inner, and the piece increases in bulk.

But this is not always found uniform in practice; for sometimes the piece of steel actually diminishes in bulk. It is found that, under certain circumstances, the compression of the particles of the central steel predominates over displacement of the particles of the outer steel by heating. In such a case, the piece will be smaller than previous to hardening. The expansion of steel is prevented, in some measure, by repeatedly annealing it, previous to its being finished; for instance, after the first "skin" is cut from the steel, anneal it; again proceed with another cutting and annealing; repeat this, say three times, then harden. Those who have practiced this say that, although a considerable amount of work is thereby involved, there is nevertheless an actual saving of labor over that which would otherwise be required in fitting steel after being hardened.

Another hint may be useful in this connection. Articles made of steel which have been well forged, will always keep truer and preserve their original dimensions better, in hardening, than articles made of badly forged steel.

**THE CAUSE OF HARDNESS OF STEEL.**

It is thought by some that the hardness of steel is caused by the compression of the whole of the particles into a denser state. As an evidence of this, the fact is cited that steel, after hardening, always looks finer and closer, in grain, than before. If this were the real or only case, would it not seriously interfere with the well known fact which we have just been considering, viz: that the particles of steel are almost always actually further apart, after than before being hardened—that is, that hardening steel increases its dimensions? That theory will not stand, and we must look farther for the philosophy of the hardening of steel.

A more plausible reason has been given

in the supposition that the particles of carbon, which have been mingled with the particles of steel, in the "cementing" process, assume a crystalline, and, of course, harder form, by the sudden cooling of the mass when plunged into water, in the act of tempering or hardening. The particles of carbon, in thus crystallizing, probably expand, the same as water does in crystallizing into ice, and thus fill up every pore in the steel, rendering the whole mass close, compact, and increased in hardness. Such an action would give hardened steel the appearance, which it certainly presents, of being closer and finer grained, than before being hardened.

These considerations are not a mere entanglement of theories, or useless speculations, designed to amuse the reader. They are mostly plain, practical facts, designed to aid in the use of sound judgment, and as such should be considered and studied carefully by every mechanic—especially by every worker in iron. The fullest success in mechanical industry is the reward only of study, as well as practice. It should be the aim of every young mechanic to know the philosophy, as well as the practice, of whatever he is called upon to perform. It is a mistaken idea that success can be obtained by practice alone; close observation and study must go with practice, or you can never rise to eminence in your profession—or if you do happen to succeed without it, your elevation will be purely accidental, and most likely quite ephemeral.

**FLOATING ELEVATORS** are to be introduced on the Mississippi river. It is calculated that they will carry grain to New Orleans on the way to New York, and farmers in Missouri, Iowa and Minnesota, and in parts of Wisconsin and Illinois will save thirty cents on every bushel. Is it not time that some means were contrived for a more convenient and economical handling of the grain crop of California, between the time at which it is harvested and that at which it is placed in the hold of a ship for exportation?

**THE VALUE OF MECHANICS.**—In the estimate of what is necessary to constitute the wealth of a nation, the mechanic stands next, and by the side of the farmer, who, when properly educated, is the most useful and the most dignified member of the community. The liberal professions contribute their share to the public prosperity as incidents in the machinery of society, but they live only as they are supported by the artisan trades, educated mechanics, like educated farmers, constituting the foundation, as well as the superstructure of the body politic. How important, then, to the public welfare, is the disposition in law-makers to elevate these valuable classes of the community. Schools cheap, if not free, should be endowed to enable the hardy, working man to study the system of mechanics as a science, that he may the more readily reduce it to an art in his practice. Scientific mechanics are the men who invent the thousand machines that effect the great desideratum of saving manual labor. Our country is proud of these citizens, whose genius beautifies all that it touches, and spreads the fame of the nation to the most distant regions of the earth. Our noble patent office is a standing monument to the energy and ingenuity of the noblest rewards, and as long as necessity is the mother of invention, the labors of the artisan will continue to multiply these trophies of industry and tact.

**AN INVENTION WANTED.**—An article, which would be of great importance to the laboring people of the United States, would be a neat wooden shoe with a flexible sole. It ought, and it can be invented. It now costs from ten to twelve dollars per year for each laborer's shoes; two pairs of wooden shoes, or \$2.50 per year, ought to shoe our laborers. Who will give us a flexible wooden shoe with a flexible sole?

**FLEXIBLE GLUE.**—A German chemist has discovered that if glue or gelatine be mixed with about one-quarter its weight of glycerine, it loses its brittleness, and becomes useful for many purposes for which it is otherwise unfit, such as dressing leather, giving elasticity to porcelain, parchment or enamelled paper, and for book-binding.

**Scientific Miscellany.**

**SPONTANEOUS CHANGES IN GLASS.**—At a recent meeting of the Academy of Sciences at Paris, M. Peligot called attention to quite a new fact which he had discovered, viz: The deterioration of glass, by which it had completely lost its transparency, while retaining its density. A piece of glass (St. Gobrain glass, prepared a long time ago by Mr. Pelouze), was placed in a drawer, supported by one extremity. After some days it was found by M. Peligot to have become curved by its own weight, and rendered malleable! The surface was also covered with effervescence.

Malleable glass is a curiosity of science, although, doubtless, the glaziers would demur to its introduction into practical existence and utility, at least for window panes. It was made in old Rome; and in the reign of Tiberius, a Roman artist had, according to Pliny, his house demolished—according to other writers he was beheaded—for making glass malleable. The art of producing malleable glass seems to have been lost during the middle ages, and the idea of rediscovering the secret was only ranked second to that of the philosopher's stone among chemists. It is said, however, that in 1835, a person at St. Etienne, France, succeeded in producing a glass, which was as malleable when cold, as when first drawn from the pot. There is also a story that Richelieu once ordered an inventor to be put to death, for proposing to divulge a process for making glass malleable.

**Change in Color.**—A year or two ago, Mr. Newell of Philadelphia, constructed a traveling photographic wagon; to light a part of which he used orange colored glass, on account of its being impermeable to the violet or actinic rays. After some time, he found himself troubled with what are technically called "foggy plates;" on substituting orange muslin for orange glass, the fog vanished from the plates, and subsequently on examining the glass, it was found to have materially changed in color.

Similar spontaneous changes in the color of glass, are by no means uncommon.

**THE PARIS EXPOSITION.**—The Paris Society for the Encouragement of National Industry, are holding weekly meetings, desiring the continuance of the World's Exposition in that city, with the view of comparing the notes and observations of the members, which may be suggested by the Exposition. It is thought that much good may be accomplished by those frequent meetings, toward the great object for which that society has been inaugurated. The merits of most of the more prominent exhibitions, and a true knowledge of what may be most widely utilized, are fully discussed at these meetings. At the first of these meetings, a few notes of the proceedings of which are before us, M. Dumas remarked that what chiefly characterized the present, over the preceding Universal Expositions, is the enormous progress which has evidently been recently made in the application of the sciences to industry and the fine arts; everywhere in those immense galleries were seen the facts and theories of pure science, materialized in practical applications of great value. "Is it not very natural," he asked, "that the Society of Encouragement should become the revealer and appreciator of the successes obtained in what may be called its special department."

**MAGNETISM OF OXYGEN.**—That oxygen gas is magnetic, has been shown by the following curious and interesting experiment: Take soapsuds, sufficiently impregnated with glycerine to make tough soap bubbles, after the manner of Plateau. Force the oxygen through this mixture, so as to form soap bubbles filled with oxygen gas. When these bubbles pass the poles of an electro-magnet, they are attracted; but when the current is broken, they fall by their superior gravity.

**CURIOUS FACTS.**—There is said to be a curious fact connected with milk, and recently discovered; for which no explanation has yet been given. If milk, a few minutes after being drawn from the cow, be cooled with rainwater, it keeps fresh many days, and can be sent to a long distance. This fact was recently communicated to the Paris Academy of Sciences, by M. Thénard, and was first communicated to scientific men by some French milk-women.

M. Debray communicated to the same body, as extraordinary, the facts that aluminum bronze compound of 95 per cent. of copper and five per cent. of aluminum, was very little attacked by acids; also that chlorine, a deadly gas, and sodium equally deleterious, when united in the form of chloride of sodium (common table salt), is not only innocuous, but healthy and preservative.

There are many similar facts, in connection with chemistry and chemical alterations, which are equally remarkable and inexplicable, in the present condition of human knowledge. Why should pure carbon, as obtained from the decomposition of any of the hydrocarbons, form one of the most combustible substances known; while the same element, when presented in the form of graphite, is one of the most inccombustible of substances?

**THE MOISTURE IN THE AIR.**—One of the most curious and interesting of the recent discoveries of science is, that it is to the presence of a very small proportion of watery vapor in our atmosphere—less than one-half of one per cent.—that much of the beneficial effect of heat is due. The rays of heat from the earth, after it has been warmed by the sun, would soon be lost in space but for the wonderful absorbent properties of these molecules of aqueous vapor, which act with many thousand times the power of the atoms of oxygen and nitrogen of which the air is composed. By this means the heat, instead of being transmitted into infinitude, as fast as produced, is stopped or dammed up and held back on its rapid course, to furnish the necessary conditions of life and growth. Let this moisture be taken from the air but for a single summer night and the sun would rise next morning upon a "world held fast in the iron grip of frost." But the power of absorption and of radiation in the same body are always equal, so that at length it is poured forth into space; else our atmosphere would become a vast reservoir of fire, and all organic life be hurried up.

**ANOTHER "NEW" ASTEROID.**—The Superintendent of the Naval Observatory at Washington, under date of July 22d, 1867, writes to the Secretary of the Navy, as follows:

Sir:—I have the honor to inform the Department that the asteroid, No. 95, of the group between Mars and Jupiter, discovered on the 7th inst., by Dr. C. H. F. Peters, at Hamilton College, was observed at this observatory by Mr. Ferguson, assistant astronomer, on the nights of the 19th and 20th. The following are its places:

M. T. Wash.		R. Asen'n. So.		Decl'nation	
July 19	20	H. M.	H. M.	DEG.	M.
11	17	1	21	35.2	22
11	5	0	21	18	53.4
					22
					55
					6.2

The asteroid is now of the 11th magnitude.

**EFFECT OF ELECTRICITY ON WIRES.**—When the electric fluid is passed through a wire, undulations of the latter are produced, and the wire is momentarily shortened. This shortening was first observed by Nairne, but no satisfactory explanation of the phenomenon has ever been given. In a paper addressed to the Academy of Sciences by M. F. P. Leroux, the subject is examined anew. Operating on wires left entirely free at their nether extremities, the undulations were quite apparent, but their order was so irregular, and they assumed such a variety of shapes that no rule could be laid down regarding them; but M. Leroux observed that the temperature caused by successive electrical discharges was not without influence upon them, and he concluded that the phenomenon alluded to involves in its explanation no new principle, and is simply a question of temperature. As the heat engendered by the discharges increases, the wire tends to expand in length by dilation, but simultaneously, and from the same cause, there is a tendency to increase in diameter, and it is to this double molecular action the undulations must be ascribed.

The Colorado River.

Mr. Samuel Adams, late of this city, who has done so much within two years past, to open up the Colorado to navigation, writes to the Philadelphia Mining Press as follows:

"My attention has been called to a notice in your paper, in which you state that it is thought the Colorado river of the West can be made at little expense navigable for 600 miles from its mouth to a point where the Union Pacific Railroad crosses the same. I have demonstrated that steamers can run successfully up the Colorado for over 600 miles from the mouth at all seasons, and with an appropriation from Congress I believe it can be made navigable for 1,500 miles from the Gulf to a point above where the Union Pacific Railroad crosses the Green river, and even to the headwaters of the Grand river or Colorado river. Some idea may be formed of the amount of water passing down the Colorado river when it is taken into consideration that it drains an extent of country of over 600,000 square miles. Of the importance of this national thoroughfare the country has but little conception. Millions can be given for a Russian purchase, and large sums expended in making an examination of that section, yet nothing can be done to demonstrate what we already have, or to open up a river of which the public are at the present time as ignorant as of the most inaccessible portions of Africa."

Mr. Adams has recently had an interview with Secretary Stanton, relative to a proposed expedition to test the extent to which the Colorado river is navigable. He asks to be furnished with an escort of forty men, and undertakes to start from Denver, the headwaters of the Grand river, or from Fort Bridger, and proceed down the river in flat boats to Colville or the mouth of the Colorado. The Secretary of War is said to favor the idea, but there appears to be some hitch with other branches of the Government. There is no question but that much good would result from such an expedition. It is high time that our Government and people knew more about this great river, which drains a larger extent of territory than any other river within our boundaries, except the Mississippi. If the Colorado river had been in the interior of Africa, the whole world would long since have been planning expeditions to ascertain its source and value for navigation, and the physical and topographical condition of the country through which it flows.

WILD SUGAR CANE IN NEVADA.—The Virginia *Trespass* says that large amounts of an excellent species of sugar cane grows wild and in great abundance along many portions of the banks of the Humboldt river, especially toward the lower portion of its course. The same plant is also seen about the sink of the Carson. Whenever the stalk is broken or punctured, which is largely done by the action of the wind, the juice exudes quite freely, and drying in the atmosphere, is converted into a most excellent sugar. The sugar forms in little balls, several of which are often attached to a single cane, and sometimes as large as walnuts. These "lumps of sugar" are gathered by the Indians by the basketfull. The *Trespass* very properly observes: "This may be an important thing to the country—finding the cause a native of the soil. It is superior to sorghum, for its blood readily granulates, which the blood of the sorghum will not, and can be manufactured only into syrup. A plant native to the soil may be found available for cultivation in lands where the more tender Asiatic plant will not thrive. Sorghum made a noted entry upon the public attention some years ago, and because of the announcement that it was harder than the common cane of the South, and could be cultivated in any soil or climate. It proved a partial failure, as we have said, on account of the impossibility of granulation. The wild cane of the Humboldt flourishes in a climate composed of all that goes to make life rough to animal or vegetable; torrid heats and severe cold by turns, with terrific winds and drifting sands. It ought to grow in any low lands in the United States, and, we believe, would—if planted and cared for the first season."

Home Trades and Manufactures.

MANUFACTURE OF SAFES, ETC.—Every new branch of industry put into successful operation here adds to the material wealth of the coast—at least to the extent of the business done, gives profitable employment to idle hands, and keeps our gold at home. A considerable amount of work in the way of large vaults for banking houses, has been turned out at the Phoenix Works, in this city, and safes have occasionally been built here and at some of our other foundries, principally to order.

It may not, however, be generally known to the public that fire and burglar-proof safes, of all sorts and sizes, are now manufactured at 815 Battery street, in this city, by Mr. Louis Chely, who is making this branch of business a specialty. The exterior, and such other portions requiring it, are made of the best wrought iron. The safes appear to be substantially built, and in every respect equal to those manufactured at the East; while they can be sold from twenty to twenty-five per cent. cheaper, which latter consideration, at least, ought to be a strong inducement for the encouragement of the home trade.

We were shown, by the proprietor of the establishment, a machine of his own invention and manufacture, designed for corking bottles, which is exceedingly simple and ingenious. The bottle is placed within a tray, so that the liquid may be saved in case of breakage. An inclined plane or wedge, operating as a slide, and worked by a treadle, raises tray and bottle to the proper point. Immediately over the bottles there are two short pistons, attached to a cross bar, connected with two cylindrical guides, which work upon each side of the frame. A downward motion being imparted to the guides, and as a consequence, to the pistons by a lever, the act of corking is instantaneous and complete. We learn that a number of these machines are now in use in different parts of the city.

THE MACHINE BARREL FACTORY, on the Potrero, under the immediate charge of Mr. J. L. Crosett, is now fairly under way, with the most flattering indications of success. A large amount of barrel stuff has already been turned out and passed into the hands of parties who set up and sell the barrels. We believe it is not the intention of this company to manufacture the barrels complete, but to simply furnish the stock—staves and heads—to the barrel-makers. The company expect to have all they can do in accomplishing this part of the process of manufacture. So great has been the demand that the company has already commenced the erection of another building, by the side of the first one, and of equal dimensions. The machinery is already on the ground for filling the same, as soon as the building is ready for it. We are pleased to record such indications of success, especially in new enterprises in our young and growing city.

NEW INCORPORATIONS.—Articles of incorporation have recently been filed in the County Clerk's office in this city as follows:

DROMEDARY G. M. Co.—Grass Valley, Cal. Aug. 28. Capital stock, \$100,000; 100 shares, \$1,000 each. Trustees: Wm. M. Lent, Jos. Clark and John T. Bradley.

FOGUS M. & M. Co.—Aug. 26. Capital stock, \$150,000; 300 shares, \$500 each. Trustees: A. J. Coghill, D. D. Shattuck and S. Henneway.

GIANT POWDER Co.—San Francisco, Cal. Aug. 22. Capital stock, \$600,000; 600 shares, \$100 each. Trustees: L. L. Robinson, Thos. Varney, H. Brickwedel and Josiah Baker.

KEARSARGE M. Co.—Inyo county, Cal. Aug. 28. Capital stock, \$3,780,000; 5,400 shares, \$700 each. Trustees: Nathaniel Page, Thos. Sunderland, E. B. Mott, Geo. Stead and Wm. N. Wade.

PEOPLES COAL M. Co.—Contra Costa county, Cal. Aug. 26. Capital stock, \$150,000; 15,000 shares, \$10 each. Trustees: L. L. Robinson, A. Caseli, H. J. Booth, C. Koopmanschap, Camilio Martin, John Hahn and Francis Locan.

QUAIL HILL M. & W. Co.—Calaveras county, Cal. August 23. Capital stock, \$480,000; 480 shares, \$1,000 each. Trustees: A. J. Pope, G. W. Beaver and W. H. V. Cronisa.

New Patents and Inventions.

Under this heading we shall mention, from week to week as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

PATENTS RECENTLY ISSUED.

67,205.—CHURN-DASHER.—Francis McFar-nahan, Santa Clara, Cal.: I claim a churn-dasher, constructed as herein described.

67,299.—TOBACCO-PIPE.—J. S. Hawley, Virginia City, Nev.: I claim the lining C, of a tobacco pipe when cut from a corn cob and inserted in the bowl A, as herein set forth for the purpose specified.

67,357.—HANGING STIRRUPS.—Prentiss Selby, San Francisco, Cal.: I claim combining with the ordinary stirrup-straps of a saddle an elastic strap that will constantly tend to keep the stirrup to the foot of the rider, while his weight is taken upon the ordinary leather strap, substantially in the manner and for the purpose described.

RECENT INVENTIONS.

BROWN'S IMPROVED STENCH TRAP.—Mr. J. J. Brown, night contractor of this city, has invented and made application through the agency connected with this office, for a patent for an "Improved Protector and Trap for Sewers and Drains." The invention comprises a water-tight trap or box, having an induction pipe leading into its front, and an eduction pipe or drain opening from it to the main sewer. This opening is made a little above the center, and is protected upon the inside by a raised vertical case or cover, open at both ends, the lowest end extending down to near the bottom of the trap; the upper portion being protected by a hinged cover. Water is received into the trap from the sink or water pipes, either from the top or sides, and may extend below the water line in the trap, to prevent the effluvia from returning to the house; or a common V-shaped trap may be made in the induction pipe. By this means a stench trap is obtained, which can be easily cleaned by removing the top, and the foul air prevented from returning into the building, by way of the induction pipes, while much cheapness and durability is obtained.

IMPROVED SAILS FOR SHIP PROPULSION. The Italian newspapers are quite elated over the alleged discovery of a new method of propelling vessels by sails, said to be the invention of a young gentleman of education, named Felice Vaglia. Should the new invention be perfected, it is expected that it will revolutionize all previous systems. Among other advantages, it is claimed for it that the amount of canvas heretofore required will be greatly reduced; and that a contrary wind, by the new rig, can be made to propel the vessel, nearly, if not quite, as well as a fair one; or, strictly speaking, all winds will be favorable.

A USEFUL SWING.—A new machine, called the "Tower Swing," has just been invented, by a Yankee, of course. It consists of a wheel, cog and treadle arrangement, by which a swiager can, with the foot, not only do his own swinging easily, but may, at the same time, set in motion a churn, a wood-saw, a pump, or a washing apparatus, as he pleases.

A NEW KIND OF SAWMILL.—The Lowell (Mass.) *Courier* describes an entirely new apparatus for manufacturing lumber, a complete sawmill, having its engine attached directly to the saw sash by the piston rod. The sash works in two upright standards of cast iron, which are made to carry the feed-rollers, etc., thus bringing the work within a very small space. Indeed, the whole mill occupies a ground space of ten feet six inches by four feet, exclusive of the cars for carrying the logs, and yet it is calculated to carry forty or fifty saws.

A NEW APPLICATION OF STEAM.—Mr. Stamm, of Milan, has made a vehicle, in which the strength of a horse is reinforced by that of steam, while the steam power gains in application the advantage of the horse's intelligence, so that they both work together, and are managed as one, by the rein. When the horse moves forward, his traction applies the steam; when he is pulled up, his backward action shuts it off, and if vigorously applied, reverses the engine, which hacks as he hacks, stops hacking as he stops, and again starts forward as he starts.

POLITICAL POLES.—It is claimed that Washington and St. Petersburg are destined to become the future political poles of the earth.

AN INSTRUCTIVE BOOK!

Prof. LAYRES'

ELEMENTS OF COMPOSITION, BELLES-LETTRES AND ORATORY. For Scholars, Teachers, Lawyers, all Professional Persons, and those of Common Education, who would improve the Eloquence and Effectiveness of their Composition and Manners of Address.

Price, postage paid, . . . \$1.10

This is a new publication, and in style and treatment of this important subject, is original, simple, plain and comprehensive. The author, Prof. LAYRES (a meritorious Teacher of good standing in California, and a sound thinker and reasoner), in his preface says: "The method pursued by the Author in developing the subject of Composition, is both the synthetical and analytical. The former is necessary to teach the theory, the latter the practice of the art; and as these are both indispensable to the scholar, so are also the two methods, as the sequel will show."

The Work has lately been approved and authorized by the State Board of Education for use in the Public Schools. To further illustrate the varied and popular endorsement the book has so rapidly received, we quote the following

RECOMMENDATIONS:

It is simple, concise, and well arranged. It seems to be a work of great value.—*John Swett.*

I am prepared to concur in the recommendation of the Honorable Superintendent of Public Instruction.—*J. C. Felton.*

After as careful and thorough perusal of the same as it was in my power to give, I came to the conclusion that, for conciseness, correctness, and precision of definition, as well as for completeness and simplicity of style, it was, and would be, without a rival. I regard your work as the best of its kind. I know of but few men in any profession who would not be benefited by its careful study.—*Wm. H. Hill.*

I regard it as one of the best treatises upon these important branches—perhaps the only one obtainable possessing equal advantages—combining completeness with conciseness, and of such simplicity in its arrangement as to be readily understood by the advanced pupil.—*F. W. Hatch.*

It is admirably arranged to develop the correct idea of the analysis and synthesis of language, and the amplification of ideas into sentences and periods. The style is clear, terse and pleasing. I do not hesitate to recommend it as a great acquisition to our text books.—*James Dennis.*

I am happy to express my conviction of the value of the whole treatise. It would give me much gratification to see so thorough and excellent a treatise emanate from young California.—*Martin Kellogg.*

I recommend it to all those who wish to obtain a book that will give them definite ideas on this subject, and teach them to express their thoughts and feelings in a clear, simple, and forcible manner.—*Caroline L. Atwood.*

I regard the book about to be published as far superior to any work extant upon that subject.—*Wm. S. Hunt, A. M.*

I believe the work will be a valuable and much needed addition to our school text-books.—*Herman Perry.*

You have brought the results of a profound analysis, and made them available, in a practical form.—*I. H. Brayton.*

I can recommend it particularly to my young friends of the legal profession, as a source from which they may be able to learn much of the successful pleadings and advocates at the forum.—*John Curry.*

The subjects upon which you treat here have heretofore been too much neglected in the education of young men in America. \* \* \* Exactly calculated to interest. \* \* \* It will soon become a necessity in every lawyer's library.—*Charles A. Tuttle.*

Its clearness and comprehensiveness make it easy.—*G. W. Donie.*

A gentleman of varied learning and ripe culture, who has had a dozen languages at his tongue's end. He seeks to teach the student not only how to take sentences apart, but how to construct them. His system has the merit of originality. We know of no work in which can be obtained so lucid an exposition of the elements of composition, and such valuable assistance in learning how to put his ideas into language. Prof. Layres has done the cause of popular education good service.—*S. F. Bulletin.*

This is a San Francisco book by a San Francisco author. It contains 166 pages, and is altogether creditable to San Francisco. It meets a public want, and meets it in a form and size cheap and convenient, and in reach of the humblest.—*Alta California.*

The writer, the lawyer, the minister, or the statesman, may study its rules and definitions with profit. Nothing conduces more to the purity of a national literary taste, than a general and thorough knowledge of the rules by which the construction of language is governed.—*S. F. Times.*

Prof. Layres plunges at once "in *media res*." He seizes a sentence (which is the unit in composition, whether written or spoken), holds it up before you; tears it to pieces before your eyes—or rather, we should say, nearly and skillfully dissects it—displays one by one its several parts; makes you thoroughly acquainted with each, in its entirety; and then shows you how to put them together again. A series of such experiments, increasing in complexity so gradually that you do not feel the difficulty, and the thing is done; you are master of the subject.—*Mining and Scientific Press.*

Its design is to show that ideas can be so arranged as to increase their power; in short, to teach the mechanism of composition, eloquence and oratory. A desideratum long felt is supplied.—*S. F. Examiner.*

This is an ace in which the occasions are rapidly multiplying, when educated men, and women, too, are called upon to express their views in writing, either for public or private inspection and criticism.—*Stockton Independent.*

The most eminent educators in California give it their hearty approval, and we concur.—*Marysville Appeal.*

Not only one of the best of its kind, but, what is still better, one of the briefest. It contains 166 pages.—*Virginia Enterprise.*

Price, \$1.10. Sent by mail, postage paid, without extra charge. Liberal reductions made to the Trade, Teachers and Schools, ordering by wholesale. Orders received by our Traveling Agents.

Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING, AUGUST 31, 1897.

Money Market.

This money market has been characterized by a fair degree of activity during the past fortnight, although no urgent demand has prevailed.

The heavy grain bills going forward at present operate as a check upon the remittance of hullion, serving the two-fold purpose of retaining the bullion in our money market, while they are equally as acceptable for remittance.

City Stocks.

We note a continued apathy in city shares, the sales in the Board during the past week being confined to a limited number of city corporations.

A small lot of the preferred stock of the Front Street, Mission and Ocean Railroad sold privately at \$20 per share. This stock is unassessable, and is entitled to a dividend of 25 cents per share, equal to 1 1/4 per cent., before the division of any of the earnings can be applied to this stock generally, after which this stock participates equally in the dividends made upon the whole number of shares.

Sales of U. S. 7 3-10 bonds were made at 80 cents, and Legal Tender Notes at 71 1/2 cents.

Mining Share Market.

During the week under review the course of this mining stock market has been very irregular, baffling the calculations of the shrewdest operators. Most descriptions of shares experienced a very material depression, under a largely increased volume of transactions.

CHOLLAR-OTOSI—continues the most active on the list and at a price little below the late rise, advancing from \$420 to \$459, receding to \$410, then selling at \$432 50, and closing at \$423.

EMPIRE—sold at \$175.....BULLION was in the market to a considerable extent at \$33 @ 37, then sold at \$34, and closed at \$35.....SIERRA NEVADA opened at \$36, declined to \$31, improved to \$35, and closed at \$30.

JUSTIS AND INDEPENDENT—sold largely at \$19 @ 22, then at \$23, and closed at \$28.....EXCHEQUER changed hands at \$12 @ 11—a large amount at this latter figure.....SEG. BELCHER realized \$6 50 @ 6.

the Superintendent for the week ending August 24th, states that 1,972 tons of ore were extracted from the mine, showing an estimated yield of \$88,091, or an average value of \$44 66 per ton; during the previous week the product was 2,210 tons of an assay value of \$43 to this ton.

CROWN POINT—declined from \$1,215 to \$1,100, rallied to \$1,120, fell to \$1,052, and closed at \$1,015. The winze from the 600-foot level is sixty feet in depth, and a drift west from this depth encountered several small seams of ore.

GOULD & CURRY—sold to a small extent, rising from \$562 50 to \$590 seller 5, and at the close declining to \$535. Since the mill started (on the first inst.) \$30,043 in hullion has been received at this office in this city.

YELLOW JACKET—has been in much less favor since our last issue, falling from \$910 to \$695 30, and closing at \$705 b 20. The extrms reticence of the officers of this company in regard to this operations at the mine, as well as of its financial condition, is very generally remarked.

IMPERIAL—sold within a range of \$136 @ 139, and at this close realized \$141. Some delay is occasioned in placing the machinery at the new shaft by the slow delivery of some of the material.

GOLD HILL QUARTZ—is in less favor, selling at \$130 @ 115 per share. The hullion returns up to the 26th of the present month amounted to \$7,500. It is generally believed that a dividend of \$10 per share will be disbursed next month.

OPHIR—sold at \$80, then at \$117, assessment delinquent, and closed at \$116. We understand that the difficulties with the Mexican company have been amicably settled. The new shaft was commenced on the 24th inst. It will be a first-class shaft, consisting of four compartments, and will be sunk at the entire expense of the Ophir company.

OVERMAN—changed hands to the extent of more than 1,000 shares, declining from \$77 50 to \$57 50, rallying to \$68, and closing yesterday at \$72. The receipts of bullion from the 1st to the 29th inst. aggregate \$12,500. A telegram received at the company's office yesterday noon states that the 300-foot level is improving, and other portions of the mine showing no change.

CONFIDENCE—sold at fluctuating rates, dropping from \$130 to \$85, improving to \$92 50, and closing at \$80. The cave in the west drift, from the third level, has interfered with the work; however, in the course of a week it will be sufficiently timbered to carry the drift to this ledge. On the fourth level they are obtaining a better quality of ore.

KENTUCK—declined from \$347 50 to \$315, improved to \$335, receded to \$325, and closed at \$305.....BELCHER receded from \$190 to \$170.....EMPIRE sold at \$175.....BULLION was in the market to a considerable extent at \$33 @ 37, then sold at \$34, and closed at \$35.....SIERRA NEVADA opened at \$36, declined to \$31, improved to \$35, and closed at \$30.

JUSTIS AND INDEPENDENT—sold largely at \$19 @ 22, then at \$23, and closed at \$28.....EXCHEQUER changed hands at \$12 @ 11—a large amount at this latter figure.....SEG. BELCHER realized \$6 50 @ 6.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,825,792.

A BIG STEER.—Mr. T. B. Newman, of Salem, Oregon, brought down to this city on the steamer Oriflamme, on her last trip, the mammoth steer "Oregon Baby." The baby is in very good circumstances as to flesh, weighs 3,800 pounds, and is 16 1/2 hands high. He was raised and bred by Mr. Thos. Cross, the famous Oregon stock raiser. Mr. Newman intends to exhibit this mountain of beef at Sacramento during the State Fair, and perhaps through other portions of the State, when he will sell him to some butcher to be slaughtered, and perhaps served up in Christmas steaks.

MINING SHAREHOLDERS' DIRECTORY.

(Compiled for every issue, from advertisements in the Mining and Scientific Press and other San Francisco Journals.)

Comprising the Names of Companies, District or County of Location; Amount and date of Assessment; Date of Meeting; Day of Delinquent Sale; and Amount and Time of Payment of Dividends.

Table with columns: NAME, LOCATION, AMOUNT, AND DATE OF ASSESSMENT, DAY OF DELINQUENT SALE, DAY OF PAYMENT OF DIVIDENDS. Lists various mining companies like Adella, Bullion, Cambridge, etc.

\*Those marked with an asterisk (\*) are advertised in this journal.

Latest Stock Prices Bid and Asked.

S. F. STOCK AND EXCHANGE BOARD.

San Francisco Market Rates.

Wholesale Prices.

Table of market rates for various commodities like Flour, Corn Meal, Wheat, Oats, Barley, Beans, Potatoes, Hay, Live Oak Wood, Eggs, Beef, Sheep, Hogs, Sugar, Coffee, Tea, Hawaiian Rice, and Chinese Rice.

Table of commodity prices: Coal Oil, Candles, Haulch Butter, Lard, Onions, Apples, Peas, Beans, Ham, Potatoes, Tomatoes, etc.

Table of Retail Prices: Butter, Pickled, Corn Meal, Flour, etc.

San Francisco Metal Market.

Table of metal market prices: Iron, Steel, Copper, Brass, Lead, Zinc, etc.

To the Legal Voters of the City and County of San Francisco.

Prompted alike by a sense of duty to myself and to the public, and in compliance with the request of several hundred citizens, tax payers and friends of the Public Schools, representing the different political sentiments, religious creeds, nationalities and classes of the San Francisco community, I hereby announce myself an Independent Candidate, at the approaching election, for the office of Superintendent of Public Schools.

San Francisco, July 29th, 1897. J. C. PELTON. 5015-5W

Pacific Mail Steamship Co's STEAMSHIPS FOR NEW YORK, JAPAN AND CHINA.

LEAVE FOLSOM STREET WHARF, AT 11 O'CLOCK, O'CLOCK A. M., on the following dates, for New York, connecting via Panama Railroad, with the Company's splendid steamers from ASPINWALL for NEW YORK. On the 10th, 18th and 30th of each month that has 31 days. On the 10th, 19th and 30th of each month that has 30 days.

OLIVER ELDRIDGE, Agent.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

If our subject was politics instead of mining, we might be able to fill half a dozen papers the size of the Press, with gleanings from our country exchanges, and we are forced to acknowledge that the political ground has been more thoroughly prospected than the various quartz ledges in the State. The consequence is, we are unable, from our situation, to furnish a full summary of California; and we again say to our country cotemporaries, if you must dabble in politics, do not lose sight altogether of the fact that the people, especially those who take an interest in the development and advancement of our resources—the intelligent class—desire to keep posted on the progress of our mines, as well as the political progress. But there will be a grand clean up of office seekers and office helpers on the 4th day of September, after which (the dog having been killed) we expect to give full and regular accounts of all strikes, discoveries, etc., which will interest our readers.

## CALIFORNIA.

## Alpine County.

*Miner*, Aug. 24th: The Morning Star Co. has been putting in air pipe to connect the north drift with the main shaft. A pump is on the way from San Francisco, and on its arrival, the work of sinking on the lode will be commenced.

Davidson's mill is running this week on Tarshish ore, having put through what the I. X. L. had out of high grade ore. First and second class Tarshish ore will be worked together, and it is the intention of Mr. Gruff to furnish the mill with 100 tons for the first run.

## Calaveras County.

The West Point correspondent of the *Chronicle*, writes Aug. 21st, as follows: In mining items, Barnes lately crushed 35 tons of rock, which paid \$15 per ton. Sletcher & Lightfoot made a small run which paid \$60 per ton; Reece & Stipes, result not ascertained.

At Railroad Flat, in the Petticoat claim, a recent clean up of 87 tons of croppings and vein stuff paid \$12 per ton. This mine has laid still for some time, and might have been bought for, say \$1,200, as the first test only paid \$6.50 per ton, though it was known to be a large vein, as the ledge at 30 ft. depth was 10 ft. wide; but the last workings have developed a large body of good ore just below the surface, and the boys are not as anxious to sell as they were. We have no hesitancy in predicting that Railroad will one day be a thriving camp. This opinion is based on the sizes of the ledges and the facilities for extracting the rock.

## El Dorado County.

Placerville *Courier*, August 24th: The Georgetown correspondent writes: A few days since the Woodside Co. was compelled to stop work upon their mine. The engine—a 15-horse power one—heing too small to keep the mine free from water. When they commenced work last spring, it required two months' pumping to dry the mine; since which time they have been unable to sink only 16 ft., and run a drift of about 30 ft. By had management, and having too much water to contend with, the company have spent all their money, and are not at this time able to erect heavy machinery. During the last working, owing to the broken up condition of the rock, but little money has been taken out. Barren spots have frequently occurred in this mine, and for the last 15 to 20 ft., it has been quite "spotted." The company feel confident that if they were able to sink 20 ft. further, they would find the ledge richer than at any previous point. Where they were compelled to abandon work, the ledge is three ft. wide and very rich in sulphurets. Work is not suspended because the mine is not good, but owing to the fact that the present machinery is not large enough. They now offer one-half of the mine to any one who will erect machinery and sink the shaft 100 ft. deeper. To properly work this mine a 40-horse engine and a 10-inch pump is required. With these improvements, the mine can be worked very cheap, as the rock is not hard.

## Inyo County.

Virginia *Enterprise*, Aug. 25th: Andy Peasley has just returned from the Cerro Gordo mines, Inyo county, California. He thinks well of the Cerro Gordo mines, but says that at present the scarcity of water is

a great drawback to the prosperity of the country.

## Kern County.

Havilah *Courier*, Aug. 17th: The St. John mine is being worked by Taylor, White & Co. We have seen some specimens of ore from this mine which are very rich—the gold being visible to the naked eye. There are now about 50 tons of rock taken out and an immense quantity in sight. The rock shown us will yield not less than \$50 to the ton. The company are engaged in the erection of a mill, which will be completed by the 1st of September. Other mines in the same district are turning out well.

## Nevada County.

Grass Valley *Union*, Aug. 27th: A one-half interest in the Empire Mining Co's property on Ophir Hill, has been recently sold for \$125,000, to Messrs. Cronise, Lake, Horner and others, of San Francisco. The purchase includes a one-half interest in the mine, the magnificent quartz mill, hoisting and pumping works, etc., on Ophir Hill. The former owners, Capt. S. W. Lee & Co., retain the other one-half interest in the property. The Empire has been one of the best quartz mines in this district, and of late the vein has been looking better than ever.

*Transcript*, Aug. 28th: The Sing Ching Co. have purchased the San Joaquin gravel claims at Birchville, paying for them \$9,600. The first payment of \$5,000 was made in cash.

**EXCELSIOR.**—Meadow Lake *Sun*, Aug. 24th: The editor reports an examination made in person of the Virginia claim, as follows: Ledges Nos. 2 and 3, each ledge containing 1,300 ft., situated in the Meadow Lake mining district, about two miles from the town of Meadow Lake, and about one mile from the town of Ossaville, on the north branch of the South Yuba river. It is one of the earliest and best locations in the District. The two ledges are wide and well defined, and assay well from all the croppings and at the depth already attained in the shafts. There have been about \$1,500 already expended in prospecting and opening this claim, and no ledge could be better situated for development by means of a tunnel, as a tunnel 200 ft. in length could be driven in in such a manner as to strike the main ledge 150 ft. below the surface, at the croppings. Like most of the ledges of this district, they are situated in a locality where wood and water is abundant; the former being easily procured in any desired quantities at from \$2.50 to \$3 per cord. There is a mill site attached to the property, located at the same time with the ledge, and duly recorded, affording at all seasons of the year an ample supply of water for steam and amalgamating purposes. This claim has for a long time attracted attention, and Orion Clements, Esq., Lieutenant Governor of the State of Nevada, in a series of short articles written upon the mines of this district, during a visit to this place in the summer of 1866, thus speaks of the Virginia claim: "On the 19th of June, 1865, were located by the Virginia Co. ledges Nos. 2 and 3, running parallel with each other—ledge No. 2 cropping out on the surface 40 ft. wide, and ledge No. 3, 20 ft. wide. On these ledges, last summer, a great deal of work was done. A shaft 8 ft. square was sunk on each ledge—on No. 2 to the depth of 25 ft. Day and night shifts were employed, and six men kept at work most of the summer. The shaft was sunk on No. 3 about 10 ft., and then the men were transferred to shaft No. 2, for the reason that as it was 100 ft. lower down the hill, by sinking a shaft 100 ft. and drifting 100 more, ledge No. 2 could be struck 200 ft. in depth. The lowest assay was \$122 in gold, except about \$15 in silver. From that time assays ran as high as \$1,000 per ton. The claim on each ledge contains 1,300 ft., both belonging to the same company. A. C. Wightman discovered and located the ledges and superintended all the work. They are a few hundred feet north of the Potosi ledge, and east of the Baltimore."

Several parcels of sulphurets from the Confidence Co's claim, Pacific ledge, have been worked during the past week by Mr. S. H. Richardson, with splendid results. In two instances, nearly \$10 were obtained from 2 lbs. and 2 ozs. of sulphurets, and in another instance, between \$3 and \$4 were obtained.

A clean-up of the arastra of the Live Oak Co. resulted in a yield of from \$75 to \$100 per ton. The rock worked was not assorted, but the full width of the ledge was taken out and worked, and the yield would have been very much larger had the ore been assorted.

During the past week, some fine ore has been taken out from the Eclipse mine, near Baltimore. There seems to be a very large body of it.

*Transcript*, Aug. 25th: J. E. Squire has been appointed Supt. of the U. S. Grant mine at Carlisle, Meadow Lake township. The new company propose erecting a new mill and extensive works on the mine.

## Sierra County.

Downieville *Messenger*, Aug. 24th: The Docile M. Co. is getting along finely with its work in sinking a shaft, and is now down about 35 ft. It gets enough from pounding up assorted rock to pay expenses. All the loose dirt is rich, and will wash up big when water can be had. The third north extension company has struck the croppings about 2,000 ft. from the Docile, and is now getting the most flattering prospects.

We saw, a few days since, some very rich specimens from the Brush Creek ledge, near the Mountain House. This ledge paid well some years since, but was lost. It has recently been recovered, and promises to pay better than ever.

The tunnel of the Greenback Co. is being rapidly pushed forward.

## ARIZONA.

*Miner*, Aug. 10th: The Vulture mill, at Wickenburg, is now running (20 stamps) regularly and profitably. Lager & Lattimore and Capt. Chapman have the contract for hauling the ore from the mine to the mill at \$10 per ton. The mill consumes 30 tons per day. Some 40 men are employed about the mill and 80 at the mine. The lode is 39 ft. wide, and the ore averages \$35 per ton, although lately it has run lower than usual. The legal troubles concerning the mill and mine have been adjusted.

July 20th, the copper mines of Martiu & Co. were sold to W. W. Dodge, of San Francisco. The Mineral Hill mine brought \$10,000 in gold.

The mines never looked better than now. In the Empire, the Supt. has struck a cross vein of copper of immense size and richness. He has 2,000 sacks of ore at the river and 1,000 more at the mine.

Supt. Fowler is putting up a large quantity of ore at the Springfield mine. Comparatively few hands are at work at any of the mines.

Messrs. Thompson, Ashley and Knowles are in San Francisco, and are not expected back until September, when more active operations will be begun.

## BRITISH COLUMBIA.

Cariboo *Sentinel*, July 22d: On William's Creek during the last week, the following amounts were cleaned up: McLaren Co., 50 ozs.; Wilson Co., 61½ ozs.; Dutch Bill Co., 20 ozs.; Davis Co., 135 ozs.; Aurora Co., 176 ozs.; Prairie Flower Co., 36 ozs.; Forest Rose Co., 14 ozs., for 18 hours work.

In Stout's Gulch during the week, the Alturas Co. washed up 169 ozs., and Mucho Oro Co., 30 ozs.

In Conklin's Gulch, the week's returns are as follows: United Co., 85 ozs.; Ericsson Co. 30 ozs., and Reid Co., 30 ozs.

Good prospects have been struck on a high bench east of Grouse Creek. Several claims have been staked off.

Week's work at Lowhee Creek, Plumbago Co., from \$10 to \$12 per day to the hand. Crittenden Co., 12 ozs.; First Chance Co., 90 ozs.

July 25th: Ross Co., on California Creek, are making \$7 per day.

Drawer, Sharp & Co. have found pieces in their claim weighing as high as \$50. The Great Eastern Co. are making \$8 per day.

The following is the testimony of a witness under oath in a chancery suit, concerning the Madoc gold mines: I am a practical miner and have washed in gold mines in California for several years, and I am fully competent to judge of the value and richness of a gold mine. That I did on Wednesday, the 1st of May, gain access to the interior, and did examine the Richardson gold mine, in company of two of the defendants, Hardin and Austin, and found that the ore in said mine was of unrivalled richness, and am of the impression that I could, with two men, extract from said mine at least \$2,000 worth of gold per day for the next seven days. That I washed out of about three pints of decomposed rock and sand, which I took out of a pail nearly filled with the same material, from \$12 to \$14 worth of gold, besides three pieces of quartz largely impregnated with gold.

July 29th: A miner while passing a pile of "headings" the other day, observed a small piece of gold. Stooping to pick it up, he found it to be in contact with a lump of quartz, which being weighed, was discovered to be worth \$101, for which sum he subsequently sold the specimen.

Aug. 1st: The First Chance Co., Lowhee Creek, took out 40 ozs. last week, among which was a nugget weighing seven ozs. On Tuesday last the Alturas Co., on Stout's Gulch, also took out a nugget weighing 7½ ounces.

## IDAHO.

Owyhee *Avalanche*, Aug. 10th: The Oro Fino mine is yielding richer ore than ever before. The last run of 70 tons cleaned up \$10,000—over \$140 per ton, and there is much more of the same class of ore in sight in the mine and some out.

The Whisky ledge is being put in the condition of a paying mine, and so far as worked is really a profitable mine. About 5½ tons of the ore were sold at the mine, and the buyer made money on the transaction. The vein is improving as it is developed—both in size and richness.

*World*, Aug. 17th: Mr. Holbrook, of Granite Creek, brought to this office on Thursday some specimen pieces of decomposed quartz, taken from a newly discovered ledge, two miles from that camp, near the very rich decomposed quartz ledge lately located by Bradford and others. The ledge prospects quite as richly as the Bradford ledge.

The camp on Granite Creek is flourishing beyond any camp in Idaho. The mines continue to pay very richly. A sale has been made of a creek claim by Mr. Brainard, to a company of Portuguese, for \$4,000.

Forty-six tons of poor surface and casing rock from the King quartz ledge, Summit Flat, lately yielded an average of \$58 per ton. The culled ore will far exceed this product. The company are running a tunnel into the Mammoth ledge, which prospects richly all the way down. They have two 8-stamp mills, and constantly employ 16 hands. It is near these ledges that miners are making big pay in ground sluicing for quartz rock, of which one party had gathered and crushed about 30 tons which averaged nearly \$100 to the ton.

The moving of the 20-stamp quartz mill from the Chickahominy ledge to the Pioneer ledge, has been accomplished, without breakage or mishap.

Mr. H. D. Van Wyck, Supt. of the Bonaparte Hill M. Co.'s mill and mine, in Alturas county, lately exhibited three pieces of quartz, which came from the company's mine. Two of them were taken from the Bonaparte ledge—one from the cropping surface, and the other from the ledge at a depth of 100 ft. in the tunnel. Both pieces were rich in gold, and that from the tunnel contained fine specks of the precious metal all through it. But the third piece, taken from what is known as the Ehell ledge, at the depth of 160 ft. in a tunnel lately sunk, is of surpassing richness. The whole piece weighs perhaps a pound, and looks well throughout, but directly through it is a vein of dark bluish hue, of an inch width, and in this the gold is seen thick and plenty everywhere. It is one of the best looking pieces of gold and silver quartz we have ever seen. The rock is hard, and is difficult to work, but of its wealth in the precious metals there can be no question. The last clean up of the ore from the Bonaparte ledge, gave a product of 216 ozs. of amalgam, worth say \$2,000, from less than 40 tons of rock.

## MONTANA.

*Post*, Aug. 3d: The Golden Gate Co. in Brown's Dist., are erecting a steam 15-stamp quartz mill.

Good diggings has been struck on the Boulder Redivivus, and from five to seven cents to the pan have been taken. All of them show very well, and the old discovery claim is paying. The bars are extensive, and can be worked by hydraulics, and will give employment to a large number of men.

Aug. 10th: A correspondent writing from Highland Gulch, says: Within the past 10 days, several new and astonishingly rich discoveries have been made on Moose Creek, contiguous to our camp. Collins, Parker, Day and Harvey, all experienced quartz prospectors, have brought in from the last named locality the finest specimens of silver ore it has ever been our good fortune to see; during 18 years residence in the mountains. The lodes discovered are said to be from 8 to 12 ft. wide. The rock blisters fine and shows the native silver in larger quantities than any other rock we ever saw. Enclosed you will find a globule of silver thrown out of the rock by a common wood fire; this I believe to be out of the Tiger lode. A piece of rock the size of an egg will show scores of such globules.

But a few feet remains to be driven to complete the level in lode No. 2 of the Whitlatch Union mine, which will at once supply the necessary ventilation for this part of the mines and give a surface of 370 ft. for working the vein, varying in width from two to six ft. of free gold bearing white flint quartz and yielding \$64.15 per ton. From discovery claim very rich quartz is now being taken for Turnley & Hendrie's mill.

Mr. Whitlatch has purchased one-half of the 30-stamp mill of the Philadelphia Enterprise Co., which is now being built in Oro Fino Gulch.

Mining matters continue to improve in

**Blue Cloud Gulch.** Splendid prospects are obtained throughout—from 75 cts. to \$1 and as high as \$12 to the pan has been obtained. The only drawback to quick fortunes is the amount of water; claim holders being unable to sluice but half the time. Claims are held at very high figures. Parties are unwilling to sell unless they get as much as they think is in the ground.

The diggings on El Dorado Bar have been found to pay \$25 per day to the hand, ground sluicing, and will give employment to 2,000 men.

**NEVADA.**

**Black Rock.**

**Enterprise, Aug. 18th:** The editor thus describes a specimen of opal from the Black Rock mines, lately exhibited in Virginia City. It is not the true fire-opal, but comes very near being—only lacking in its composition 1½ per cent. more of water. The specimen shown us yesterday was in the possession of Mr. R. A. Cochran, and appeared to us as a sort of cross between precious opal and moss agate. Mr. Cochran says that in the Black Rock country there is an extensive belt in which opalescent minerals are abundant.

**Esmeralda.**

The Pine Grove correspondent of the Virginia Enterprise, of Aug. 20th, writes: The Wilson, Midas and Wheeler Cos. continue to take out rock enough to pay the expense of running long tunnels for the main ledge and otherwise developing their mine. The Midas will have, by the first of next month, a run of 75 tons of ore extracted, which will pay \$75 per ton.

H. C. Toombs is taking ore out of the Wilson croppings. He pays for it \$12 per ton.

Smith & Reynolds are engaged in taking 100 tons of ore out of their segregated Mountain View claim, which they will offer for sale.

The Wheeler boys are busy taking out ore from a rich vein recently struck near their old shaft, and are also running a new tunnel, which is now in some 50 ft.

About 145 tons of ore from the Burlesque claim was lately crushed by Capt. Pray's mill, which did not pay for crushing. The ore is largely composed of sulphurets.

The Deposit No. 3, adjoining the Burlesque on the south, worked by Joe Collins and others, shows a number of very fine veins of copper-stained gold-bearing and sulphureted quartz. Fifty-three tons of the ore from this claim were worked by Capt. Pray's mill, and although the ores prospected finely with horn washings in free gold, the returns made by the mill were very dissatisfactory.

The Imperial Co. struck a very rich body of ore in their shaft, at water level, some time ago, and have since been running a tunnel for the purpose of tapping the ledge at a lower point and draining the water.

Penrod's arastras are giving the most satisfactory results, and are kept running constantly.

**Humboldt.**

Unionville Register, Aug. 17th: Torrey has made two more shipments of several tons of bullion, by large freight teams. He is now getting things to work to his notion, and is making a most complete success.

The Star City correspondent writes that the American Basin Co. are driving their tunnel, with three shifts, day and night.

Drifts have been run across the DeSoto ledge in various places, and rich ore found in all of them, proving it to be a true vein of enduring richness. A small force is at work preparing to take out ore, which can be done in sufficient quantities to keep all the mills in the country running.

Late advices from the reported placer gold discoveries show that they are not likely to prove as rich as was at first anticipated. No mines have yet been worked that have yielded surface gold in paying quantities. Some very rich quartz ledges, however, have been discovered.

**Trespass, Aug. 20th:** Work goes on in the Humboldt mines. Torrey, at Oreana, is turning out bullion in considerable quantities. His Daisy and other ledges are showing finely. He has trouble with the working of the furnaces as at present arranged, because of the fumes poisoning the men who work at them. This will be remedied as soon as possible by the erection of stacks to carry off and condense the vapors.

Ginaca's mill has been landed on the ground in Winnemucca District, and will be put in working order as soon as possible. Gov. Fall has shipped out a mill for the Essex mine, in Sierra Dist. Fall is also driving ahead with the tunnel for the Agamemnon ledge.

Ely's mill will soon be put up to work rock from the Monroe ledge.

**Pahranaugut.**

Silver Bend Reporter, Aug. 17th: The New York mining companies have all sus-

pending work, having conducted operations upon credit as long as the miners would stand it. Funds are expected, however, within a day or two, when there would be a general jubilee. The new mill at Crescent City (Hatfield's) was set in motion and kept at work for about ten days upon ore from the List lode. The result was all that could be wished for or expected. This is a cheering feature; but as the entire structure was put up on credit, a suspension was necessary, and it is now locked up and will remain so until money arrives to liquidate the indebtedness against it.

**Reese River.**

**Reville, Aug. 15th:** The La Plata Co. has struck a fine body of ore in the lower level of the Twin Ophirs mine, situated in Park Cañon. The tough, hard character of the rock rendered the work on the mine tedious and slow, and it is gratifying to learn that the ledge has been struck at last. The ore found in the deep level is said to be very superior to that met with above.

T. J. Tennant, who has just returned from McCann creek, says that in digging the grave for McCabe, who died there, they sunk to the depth of five ft. without disclosing the bed rock. The earth thrown from the grave was washed, and every pan of it contained slight "colors." Mr. Tennant did not see or hear of a pan of dirt washed that did not yield the "color," although it was obtained from the grass roots on the surface.

**Aug. 18th:** On Saturday, some 500 lbs. of quartz from the Beard ledge at McCann Gulch were brought into town. It is peculiar looking ore, and much resembles that obtained in the Black Rock Dist. The lot was evidently procured from the surface, and appears to be chiefly decomposed porphyry, of a grayish white color, covered with brownish stains on the outside. These pieces do not show any gold, but may do so after being pulverized and washed, or by assay. Some choice specimens were shown to us in which the gold was palpable to the eye.

**Aug. 20th:** A small but rich stratum of ore has been struck in the lower level of the incline on the Metacom mine. The ore is a soft black mass of sulphuret, mixed with clay. A sample of it was assayed yesterday by Boalt & Stetefeldt, which gave the large yield of \$2,069.01 of silver per ton. This coal-black ore resembles that produced by the Chase mine, and is wholly unlike any heretofore found in the Metacom.

**Aug. 21st:** The Chase mine is now yielding a very rich quality of ore, assays of which exceed \$3,000 per ton. Some 30 tons of the first class ore are on the dump ready for the mill. The ore was taken from the original excavation at a point where the ledge is of good size, and it is of so high a grade that the deposit is usually called a "chimney."

At a meeting of claim holders of Kinsley Dist., Lander county, on the 15th day of Aug., the laws of the district was amended so that all titles to mining claims heretofore made and recorded, shall hold good until the completion of the Pacific Railroad, to a point opposite to said district, and that \$250 value in work or money shall entitle the claimants to their claims in fee.

**Aug. 22d:** Part of the Keystone mill was destroyed by fire on the night of the 21st. More than half the roof was burned off, and two of the furnaces was so much damaged by the water used in extinguishing the fire, that they will have to be rebuilt. Loss from \$6,000 to \$7,000. Cause, carelessness.

Water is getting troublesome in the Savannah mine, so much so that it is necessary to erect hoisting machinery in order to free the mine. Until the hoisting apparatus is finished, there will be but slight addition to the dump pile, which now contains about 30 tons of first and second class ore.

**Aug. 23d:** The mill of the Old Dominion Co., in the Hot Creek Dist., is nearly finished. Terry McGinnis, a famous builder of furnaces, had arrived in the district on Tuesday for the purpose of building the necessary furnaces for the mill. The building of the mill has given an impetus to mining in the Hot Creek as well as neighboring districts, and parties have contracted to deliver at the mill a number of tons of ore from both Morey and Reville.

Coover's 5-stamp mill in Bunker Dist., is working satisfactorily on ore from the Victorine ledge. The owners of the mill have agreed to work 1,000 tons at certain rates. The mill will reduce 60 tons per day.

This morning, some 1,400 ozs. of crude bullion were brought to town from the Bunker Dist. It is the product of about 10 tons of ore from the Brown ledge in that district, worked in an arastra by Messrs. Lemmon and Smith.

Silver Bend Reporter, Aug. 17th: The shaft on the Silver Queen ledge is now down

from the croppings 70 ft. The ledge is five feet thick, with a stratum of pay ore 2½ ft. thick.

On the 10th inst., the mill of the Mount Tenabo Co. in Cortez Dist., forwarded to Austin 16 bars of bullion, valued at \$14,000.

**Reville, Aug. 23d:** The Rutland mill has again changed hands, the agent of the New York and South Twin Co. having purchased the interest of J. S. French.

**Aug. 24th:** This morning two wagons arrived in town with mill machinery for Belmont. One wagon contained machinery for the Belmont Co., and the other for the Combination Co.

The assay office attached to the Manhattan mill received for the week ending this date, 48,379 ozs. of crude bullion for melting and assay.

**Trespass, Aug. 27th:** The editor has seen two assays of ore from Washington Dist., made by Conrad Weigand, which showed, in silver, per ton, \$194 and \$213, respectively. If not refractory, there is a large quantity of this ore now ready for reduction.

**Aug. 24th:** The San Plata Co. has disclosed a large body of rich ore in the lower level of the Twin Ophirs mine, Park Cañon.

**Washoe.**

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

**Enterprise, Aug. 20th:** The workmen in the Chollar-Potosi, at the depth of 965 ft. below the surface, have come upon a deposit of excellent ore. The extent of the deposit is not known.

A strike is reported to have been made in the Overman yesterday morning.

The Sierra Nevada is now clear of water, and work will be commenced immediately.

**Aug. 21st:** The ore taken out and reduced last week by the Gold Hill Quartz Mill and Mining Co., Gold Hill, averaged \$42 per ton.

**Aug. 22d:** The Yellow Jacket Co. have just received and will at once set up two new boilers, each 16 ft. in length by 54 in. in diameter. Each boiler contains 50 three-inch tubes. The boilers were manufactured at the Pioneer Boiler Works.

The Kentucky Co. are engaged in overhauling their hoisting works. They are putting in new reels, repairing their shaft, and putting everything in order for a long siege of heavy work.

**Aug. 24th:** The tunnel connecting the old and new works on the Hale & Norcross is completed. Sinking upon the new shaft will be vigorously continued.

A new machine for concentrating tailings has been invented and tested by a miner named Holden. It has been put in operation at the Ophir mill, and bids fair to prove a success. The tailings concentrated by the new apparatus yield about \$200 per ton.

The total amount of bullion shipped from this city and Gold Hill for the past week, was 8,715 lbs., worth \$224,018.44.

**Trespass, Aug. 24th:** Work is to be resumed on the Deuvylheimer lode, at Peavine; and by the time the railroad reaches Crystal Peak, the smelting furnaces will be completed, and a large quantity of ore smelted for shipping.

**Aug. 27th:** Mining is active at Wilson Dist. Quite a large amount of ore has been sent to Washoe, to be treated in a scientific manner.

The body of ore cut in the Chollar-Potosi shaft, at the 800-ft. level, is of most excellent quality, and the lode widens as it is sunk upon.

**OREGON.**

**Albany Journal, Aug. 23d:** C. H. Moses and Squire Wilbur, of this city, went out into the mountains for the purpose of hunting and prospecting. They returned last Saturday, bringing in some fine specimens of auriferous quartz, taken from a ledge near the old quartz discoveries on Blue River, and not more than 50 miles from this city. They opened a clearly defined ledge about half way down the mountain. Gold can be seen in most of the rock with the naked eye; and the quartz is easily crushed and contains gold in large quantities. They are confident that the specimens brought back for testing are no more than the average of some 500 or 600 lbs. of rock taken out. They crushed in a mortar what they brought with them on their riding horses. The average yield per pound was \$1.13; or \$2,260 per ton. They have taken up claims, and intend commencing working the ledge as soon as possible.

**Dalles Mountaineer, Aug. 24th:** Two hundred pounds of gold dust was brought down from Cañon City, on the stages by passengers last Thursday.

**UTAH.**

Salt Lake Vedette, Aug. 17th: The Fort Bridger correspondent writes as follows: From what we have seen of the country, we

have no hesitation in giving it as our opinion that no better or more extensive gold quartz bearing range has been found than this "Shoshone mining district," as it is called. The ledges are large, well defined, and crop out boldly for miles, running northerly and southerly, with a uniform dip to the east. In nearly every piece of quartz you pick up, traces of gold can be found. Placer diggings will undoubtedly be found in the district as soon as any prospecting in that line is done. As yet, nothing worth speaking of has been done towards discerning wash gold.

Parties continue to fit out and start for the South Pass mines. Unbounded confidence is felt in their richness and extent by those who have been there. One company, owning 3,000 ft., has made an assessment of \$800, for the purpose of developing the ledge.

From private advices we learn that J. Marion Moore, one of the discoverers of the Boise mines, and the most extensive as well as energetic miner that ever was in the Boise Basin, will be here this week with from 40 to 60 men, destined for the new mines on the Sweetwater.

One copy, six months, in advance, 3 00  
For sale by Carriers and Newsdealers.

WRITERS should be cautious about addressing correspondence relating to the business or interests of a firm to an individual member thereof, whose absence at the time might cause delay.

POSTMASTERS are requested to punctually inform us of the removal of subscribers of the Press from their locality, or of neglect to take the paper out of the office from any cause—when the subscriber omits that duty himself. It is not our intention to send this journal to any party longer than it is desired. If we inadvertently do so, subscribers and others will please inform us.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. Jan. 11, 1866.

Dr. L. G. Yates is our duly authorized traveling agent. July 6, 1867.

Mr. A. B. Butler is a duly authorized traveling agent for this paper. July 15, 1867.

Mr. W. D. Root is an authorized agent for this paper for Nevada State. August 1, 1867.

Mr. H. C. Northrop, is our duly authorized agent for Oregon, Washington, Idaho, and Montana. Aug. 17.

## San Francisco:

Saturday Morning, Aug. 31, 1867.

## Notices to Correspondents.

I. C. Folsom.—The structure of granite, as attempted to be explained by Mr. Sorby—a brief recapitulation of which theory was inserted on the 67th page of our current volume—contains an hypothesis which, though possibly correct in many, and we think it probable that it is so in some instances, is based on too much supposition to meet with adhesion from deep thinkers. The formation of cavities or vesicles in granite, or any other rock of like character, is susceptible of explanation by many other means than the vapor of water. We readily admit that of granitic or other similarly formed rock, that it is quite easy to conceive that under an intense heat and enormous pressure, granite or similar rock, even while in a fused state, may become, to a large extent, saturated with aqueous vapor; and thus cause cavities which may subsequently become filled by infiltration, either wholly or partially, with solid substances, or by saline and aqueous ones, in a fluid form, as described by Mr. Sorby. Mr. Poulet Scrope's admirable illustrations on this point, drawn from observations of the rocks of Auvergne, Mont D'or, Puy de Dome, etc., form a complete case in point. It is not, however, necessary, in all cases, that analogous rocks must become vesicular by means of aqueous vapor only. The presence of a vaporized solid or any gaseous matter would, under a like set of circumstances, be equally productive of similar phenomena. The fact just stated is not infrequently exhibited, to the great annoyance of the glass manufacturer, in the air bubbles, as they are called, sometimes seen in manufactured glass; yet such glass may have been for hours in a molten fluid condition previous to being shaped into any given utilitarian form, as a common glass bottle, for instance.

A PRACTICAL MAN, who inquires as to the best and cheapest mode of obtaining black diamonds for drilling purposes, such as were alluded to in our publication of the 1st of June last, at page 339, is informed that we hope shortly to be able to inform our correspondent and readers of additional particulars, which are promised to be furnished us by a gentleman, who has examined such diamonds, which he saw many years ago, and is acquainted with their commercial history. If the diamond drilling machine proves as advantageous as has been asserted to have been found in executing the Tavasa tunnel, few subjects can be more interesting to the mining community; whilst to the chemist and geologist their origin is of an intrinsic and highly theoretic value.

SANTIAM MINES IN OREGON.—We understand that a competent person is about to take hold of and develop the Santiam mines in Oregon. No doubt is felt among the owners of the mine but that the ore can be made, by proper management, to pay handsomely.

## The State Agricultural Fair.

There seems to be a general waking up everywhere throughout the State, to the advantages to be gained from a proper exhibition of the united agricultural and mechanical interests of the State, at the coming State Fair at Sacramento. An interest seems to have been excited, not only on the part of individuals, but also among the officers of the various district and county agricultural societies as well. This augurs well for the success of the enterprise, and insures a general union of all parties in carrying out the programme, and rendering the State Agricultural Fair a success. "This," says the Sacramento Union, "is as it should be. Every county should have its local society and hold its local fair, to show to the people of the vicinity the evidences of local resources and prosperity, and to excite emulation and effort for improvement. The State Society presents an opportunity for each locality to compare its products with those of each and all others, and thus stimulate all. But the greatest advantage the State Society presents to all localities in the State is, that it furnishes them a truthful and reliable medium through which correct information as to their resources and advantages can be conveyed to the people of other States and countries, and thus induce immigration and direct to the locality presenting the greatest inducements."

The San Joaquin Valley Society has appointed a special committee to cooperate with the State Society in furthering the enterprise, and have issued a stirring address to arouse the people of that part of the State, to the policy and necessity of securing a full display of their industrial products at the approaching Fair.

The motive power and shafting is already in place at the Fair building, and all machinery intended for operation should be upon the ground early next week, so that the exhibition can open complete with everything in motion, on Monday, the 9th inst. As the exhibition continues for only one week, every one must see the necessity of being prompt and having everything in place on the first day, in order to secure the full benefit of the expenses which they may incur. Those who have witnessed the tardiness, inconvenience and loss to exhibitors at most of our past exhibitions, both in this city and at Sacramento, will appreciate the force of our suggestions.

## A GENEROUS AND TIMELY PROPOSITION.

Horace Hawes, Esq., having expressed a willingness to let the Mechanics' Institute have the free use of a lot for their Fair next year, a committee waited upon him on Tuesday last, and he generously offered to let them have a hundred-rod lot on Ninth street, between Howard and Folsom, for two years. The committee thanked him for the kind offer, and assured him it would be most acceptable. The lot is on the summit of a hill, which slopes towards the Mission in one direction and towards the business part of the city in the other. A Fair building erected here will occupy a commanding and beautiful position. Both the Howard and Folsom street cars pass directly by it, and the Market street and Hayes Valley cars within two blocks. In every way the locality is excellent, and easy of access. The offer will be of material assistance to the Institute, and will enable them to commence their calculations and preparations for the Fair of 1868 without delay.

SILVER IN WEST VIRGINIA.—A correspondent of the Wheeling *Intelligencer* says that four different companies, operating within a distance of three miles of each other, have struck silver ore, within depths varying from 400 feet at the deepest up to 260 feet from the surface. The claims appear to hold all upon the same vein. Further developments are looked for with much interest.

## Platinum in New Zealand.

A very important discovery of platinum has recently been reported in New Zealand. A miner from that island was recently at Melbourne, where he exhibited a quantity of metallic sand, which he said he had gathered on the coast of the island named, and stated, furthermore, "that there was any quantity of the same material where that came from." The sample was examined and assayed by the assayer of the Union bank at Melbourne, and was proved to be a valuable platinum ore, of a highly magnetic character, containing some 60 or 70 per cent. of platinum. Throughout the sample were to be seen minute pieces of rough gold. Specific gravity of ore, 14.2.

The assayer says in his report: "It may be interesting to state that while experimenting with the microscope I soon found that many of the individual flakes possessed polarity. I carried the experiment further by floating some fine pieces on a drop of water placed on a glass slide, around which was placed a fine insulated copper wire. On transmitting a galvanic current through this impromptu coil, the major axis of many of these little flakes at once took up a position at right angles to the current, and as rapidly reversed themselves on the poles of the battery being changed."

Should this ore be found in such abundance as represented by the miner who produced this sample, it will be of much commercial importance, and add greatly to the value of the mineral products of New Zealand.

Important improvements have recently been introduced into the working manipulation of this metal, by which it is expected that articles manufactured from it will soon be greatly reduced in price. All that is now wanted to realize this anticipation, is to find the ore in greater abundance than it has hitherto been met with. Possibly the discovery reported above may lead to the desired result, and introduce this most valuable and imperishable of the useful metals into many of the arts, from which it is now restricted on account of its great cost.

A parcel of this sand has been sent to London by one of the principal metallurgists of Melbourne, to ascertain more definitely its full commercial value, and the facilities for utilizing the same. There is probably no mineral discovery which could be of more importance to the world at the present time, than that which should reduce the cost of platinum, from its present value of about eight times that of silver, to an equal value with the last named metal.

THE MISSOURI TIN DISCOVERY.—The Madison County *Conservative*, in alluding to the recent discovery of tin in Missouri, says: "The gentlemen who have been working the recently discovered tin mines, ten miles west of Fredericktown, are evidently well pleased with the prospect of opening a tin mine. A few days ago one of the parties, Mr. George S. Sane, of St. Louis, purchased of Mrs. Lloyd 200 acres, on which tin has been discovered, for the sum of \$7,000; paying \$1,000 down and the balance in 90 days. This is another item of wealth to be added to the long list of valuable minerals found in Madison county. We have many hills in our county too poor for agricultural purposes, unless it be for orchards and vineyards; and as God never made anything in vain, it is but reasonable to suppose that these hills contain something more valuable than appears on the surface."

Another Missouri paper says that there is a fair prospect that they will soon have a tin fever in Missouri, as bad as the oil fever that lately raged in Pennsylvania. All the State is going wild about this discovery. Every man has a lump of ore in one pocket and a blow-pipe in the other. Speculators are buying up the farms, and stock-jobbing is fast usurping the place of honest labor. For one man who gets rich, we venture to say, that ten will be ruined by mining companies. This discovery has been made near the famous Iron Mountain.

CONTINENTAL Life Insurance Company, 302 Montgomery street, corner of Pine.

## Yield of Australian Mines.

The gold fields of Australia are located in the southeastern extremity of the island, and occupy but a very small portion of the same. They lie chiefly in the province of Victoria, of which Melbourne is the chief commercial port; although the yield of New South Wales, the adjoining province, is very considerable.

It appears from *Dicker's Mining Record* that there are sixty-one dividend-paying quartz mines in Victoria, working under the Limited Liability Act, besides a large number of other paying mines worked on the cooperative system. There are also numerous "progressive" mines, whose progress and prospects are regularly reported.

The *Record* of February 26th contains a tabulated list of eighty quartz mining companies in New South Wales, with the number of tons crushed and amount of yield of each for the quarter ending December 31st, 1866. From this list we gather the fact that these companies, during the last quarter of 1866, crushed 160,169 tons, from which was extracted an aggregate of 83,874 ounces of gold, equivalent to .523 per ton—a fraction over half an ounce. A careful consideration of this table gives one a very good idea of the general yield of the Australian gold mines.

In carefully looking over this list of eighty mines, we find ten with a reported yield of less than one-quarter of an ounce, and twenty-six less than one-half an ounce; fifty-seven less than one ounce, and only twenty-three whose yield exceeded an ounce. One company is reported as having crushed 2,900 tons in three months, at a yield of a fraction short of one-twelfth of an ounce to the ton!

There are very few mines in the list, which are worked to any extent, that reach a yield of one ounce to the ton. We note but four which produced 1,000 tons or over, with a yield that reached or exceeded one ounce to the ton. The highest yield reported was five ounces, by a mine from which only sixty tons were crushed. Of the eight mines which produced rock worth two ounces and over, only two produced as much as 250 tons, and one of them paid two ounces to the ton for 866 tons worked.

The number of men engaged in mining in Australia, at the present time, is estimated at from 80,000 to 90,000. The total population of Australia is about 1,000,000—600,000 of whom reside in the two gold-producing colonies.

Considerable attention is being called to the loss of gold in the quartz mines, and a few of the most enterprising engineers are doing their best to remedy the same. The average loss is set at fully one-third of the total assay value of the rock. The millmen generally appear to be very indifferent to the subject, more so, if possible, than in California.

DEED.—In Nevada City, on the 21st inst., after a short illness, Mr. William Heugh, aged 56 years. Mr. Heugh was one of the proprietors of the Nevada Foundry, a Scotchman by birth, and one of the best machinists in the country. He was highly esteemed as a citizen, having been a resident of Nevada some sixteen years. We have known him since 1852, and more than once have had occasion to call to our aid his valuable services, under circumstances which called for the highest efforts of mechanical genius.

THE North American claim, at Michigan Bluffs, is said to have yielded about \$300,000 since it was first opened. Nitro-glycerine has recently been introduced into this mine as a blasting agent. It is said to take a better hold of the cement in breaking it down than powder does.

WOODWARD'S GARDENS.—It will be seen from the advertisement which appears to-day, that new attractions are being continually added to the variety heretofore presented.

**Cut-off Engines.**

Our millmen, and others who have occasion to use steam power, we are convinced, are, as a general rule, far too regardless or ignorant of the advantage and economy of using only a first-class engine. In the Atlantic States and Europe, where fuel is abundant and cheap, every device is resorted to to reduce its consumption to the lowest possible point; while on this coast, with far dearer fuel, the matter is almost wholly neglected. It is generally estimated that a first rate variable cut-off engine will save, as compared with a good slide valve engine of the ordinary construction, from one-fifth to one-third the quantity of fuel consumed. A very little arithmetic will show how important a saving this is. The difference will be sufficiently marked here in San Francisco, or in any of our mountain towns; but, for a stronger illustration, take the silver mining region in Nevada. There is many a mill or mine at or about Virginia City which requires say ten cords of wood per day to run the mill, or pumping and hoisting works, as the case may be. This ten cords of wood costs \$16 per cord, equal to \$160 per day, or \$48,000 per year of 300 working days. Suppose a more perfect engine will save twenty-five per cent. (not an extravagant estimate) in the consumption of fuel. The result is an aggregate saving of \$12,000 in a year—enough to almost make the difference between an assessment and a dividend; large enough, at all events, to claim the attention of all prudent managers. In view of so large a saving, the difference in first cost between a cut-off and a common engine becomes a matter of no small consequence.

One of the best of these improved engines is Wright's variable cut-off, which has been made very largely for the Eastern markets by the Woodruff & Beach Co., at Hartford, Conn. In our walks among the machine shops, a few days since, we were pleased to learn that Goddard & Co., of this city, were making these engines, one of which, then completed, they were about shipping to the Crown Point Company, for their new works at Gold Hill. This engine was of very superior finish and workmanship, handsome in architectural form and outline, and simple, strong and substantial in construction. We have no doubt that it will do all that is claimed for it. Goddard & Co. have other orders in hand, and anticipate large sales, which we hope may be realized.

BEERS corner of Pine and Kearny streets, makes a specialty of filling the fangs of dead Teeth, and building up broken crowns with PURE GOLD—thus restoring them to their original usefulness and beauty.  
Call and examine the work. Finest quality of artificial work also manufactured. 1v1614f

**HANSBROW'S CHALLENGE  
Deep-Well, Mining and Double-Cylinder Patent Pumps.**

These Pumps combine all the advantages of the common Lift and the Double-Acting Suction and Force Pumps, and are equally fitted for all—Household, Farm, Mill, Manufactory, Brewery, Ship, Railway, Mining, and other purposes, and are especially recommended on account of their lightness, compactness, durability, cheapness, and the facility with which they can be placed in any position.

They are adapted for Hand, Steam, Horse, Water, or Wind Power. They are more durable in all their parts than any other Pumps of the same power.

Four-Inch Deep-Well Pump.

The Valves are of the simplest construction, and can be readily taken out by loosening two common nuts. They are not liable to get out of order, and can at all times be removed without the aid of a skillful mechanic.

The lower valves of these Pumps work upon inclined seats, which prevents sand or other matter that the Pumps may take up, from remaining under the valves, or stopping the flow of water.

These Pumps are worked with less friction, and consequently require less power than any other Double-Acting Pumps of equal capacity.

All sizes, from 2-inch to 8-inch Cylinder, manufactured by the Pacific Iron Works, GODDARD & CO., and for sale by the Agents,  
**LOCKE & MONTAGUE,**

**Perry Davis' Vegetable Pain Killer.**  
A CERTAIN ANTIDOTE FOR POISON.—REV. T. ALLEN, writing from Tavoy, Burmah, says: "Within the past four years I have used and disposed of about five hundred bottles, but am now out. Please send me a fresh supply as soon as you can—say two hundred bottles. I dare not be without it myself, and there are endless calls for it, both by Burmahs and Karens. I always take it with me in the jungles and have frequent occasion to use it, both on myself and others. One night, while sleeping in an open Zayat, I was awoken by a most excruciating pain in my foot. On examination, I found I had been bitten by a centipede. I immediately applied the Pain Killer, and found instant relief. In less than an hour I was again asleep."  
Rev. Mr. Hibbard, writing from Burmah to his father, says: "I have used Davis' Pain Killer for Coughs, Colds, Summer Complaints, Burns, and for the Sting of Scorpions, with uniform success. We always keep it where we can lay our hands on it in the dark, if need be."  
Sold by all Medicine Dealers everywhere. 6v15-1m

**Brown's Filtering Heater.**—For preventing incrustation in Steam Boilers, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler—repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to 5v14-1y AUSTIN A. WELLS, Agent.

**A TERRIBLE PEST.**—The journals report that swarms of poisonous flies have made their appearance in Transylvania, and that more than one hundred head of cattle have perished. The farmers are compelled to keep their beasts shut up, and large fires are burning night and day around the sheds to keep off this unwelcome visitation. During one day, when the rain fell copiously, they disappeared; but as soon as the weather became fine again, they returned. The men in charge of the fires have the greatest difficulty in preserving themselves from their venomous attacks, and find tobacco the best preservative.

**THE WISDOM OF PROVIDENCE** is often made strikingly manifest in the most trivial matters. As an instance, neither dog or wild animal can track the doe while her fawn is unable to take care of itself. Next to Providence is the father. As carefully should be protect the innocent and helpless of his family.

**A STRANGE STORY.**—The DeKalb (Ill.) Journal of July 20th says: "On Saturday last, as Thomas Scott, one of the workmen at the Gardner coal mine, on the Chicago and Alton Railroad, was driving an entry in the coal vein, at a depth of nearly two hundred feet from the surface, he found imbedded in the coal, next to the face of the limestone rock overhead, a square block of stone eighteen inches in length, one foot wide and thirteen inches thick, partially hollow, and having the appearance of petrified wood. In the center was found two plates that appear to be solid gold. They are three inches in length, about two inches in width and three-eighths of an inch thick. On each are some curious inscriptions and hieroglyphics. The owner has been prevailed upon to permit them to be sent to New York, where it is to be hoped the inscriptions may be deciphered. The Gardner Coal Company have become responsible to the miner for the safe return of the plates or their full value.

MOSHEIMER'S PIONEER MINING SCHOOL Metallurgical Works.

Having established the first Practical Mining and Metallurgical School in the United States, I would call the attention of gentlemen who may wish to obtain a practical knowledge of Chemistry, Metallurgy, etc., to the fact that I am now prepared to teach the following branches:

- 1. Assaying of ores, metals and other mineral substances.
2. Technology, or Chemistry, as applied to any special branch of manufacturing.
3. Metallurgy of gold, silver, lead, copper, etc., by smelting, amalgamating, lixiviation, etc.
4. Gold extraction by chlorine gas; also, a modified process of the same, which is cheaper and quicker than the processes usually employed.
5. Concentration. Dressing of ores.
6. Construction of furnaces, in which any kind of fuel may be used for smelting, roasting, etc., as well as the erection of any machinery or apparatus required in metallurgy and technology.
Mining is considered by many a very hazardous undertaking; but I can assure anyone that our mines are as safe an investment as any other business when properly understood and managed; therefore, learn first. If you have a mine, then study the nature of the ore, and how to work it, and you will never fail to be successful.
It may not be superfluous to state that I am theoretically and practically acquainted with all the branches I offer to teach. Years of actual experience in the laboratory, smelting works, quartz mills, and other manufacturing concerns on my own account, have not only given me lessons, but more than ordinary ability.
I was the first one in California who successfully extracted silver by smelting, on a large scale, and have since been traveling through the manufacturing and mining towns of Europe, to study all improvements, and am now again the only one in San Francisco who undertakes to work any kind of ores by either roasting, smelting, lixiviation, or chlorination process.
I also undertake the erection of smelting and roasting furnaces, and furnish plans and estimates for any kind of works.
My lately invented Roasting Furnace has the following advantages: A furnace of the capacity to roast one to one and a half tons of ore per day can be built for \$30. It requires half a cord of wood per ton of sulphurets. The total expenses of roasting are not over \$5. The roasting is more perfect, as the ore appears in a spongy condition and eagerly takes up the chlorine gas or quicksilver when amalgamated. A large size furnace in successful operation may be seen, by permission of Mr. Maltman, in his works in Nevada City. Several others are in progress of building.
Charges for assaying gold or silver ores.....\$3 00
Copper ores.....\$5 00
Practical Chemist, Metallurgist, etc.

EUROPEAN METALLURGICAL WORKS, Practical Mining School, Bryant Street, Between Third and Fourth, SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphuret, pyrites, and the so-called "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

PRACTICAL MINING SCHOOL. The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business. S. P. KIMBALL, J. R. MORPHY, 10v10

J. A. BAUER, Chemical Laboratory AND DRUG STORE, 644 Washington Street. [Established 1849.] SAN FRANCISCO. Careful Analyses made of Ores, Minerals, Waters, Oils, Liquors, Wines, Products of Art, etc.

Pharmaceutical Preparations Made to Order. Opinions given on Chemical Questions and Oology. Particular attention paid to Analyses of all kinds, in cases where legal questions are involved. Pure Nitric Acid, Nitrate of Silver, Oold Chloride, Platin Chloride, Sodium Amalgam, Sulphate of Copper, etc. 12v14-6m

LACOUR'S SARSAPARIPHERE BITTERS

Have so speedily grown in favor that their unrivaled sale has attracted remarks and criticisms of the trade. Jealousy attributes their success to the bitterness of their general style, and principally to the originality and beauty of the bottle, which was conceived and manufactured by California artists. MR. LACOUR, an energetic promoter of California resources, desired to show that California has no need of being tributary to other countries for talent or mechanical industry. The cause of their success is the great benefit they have been to the large number who have already used them. MR. LACOUR is a graduate of the Polytechnic Institute of France, and adds to a thorough knowledge of Chemistry many years of experience; and, after a long and careful experimental study, has been enabled to offer

LACOUR'S SARSAPARIPHERE BITTERS.

They are the most efficient Blood Purifier, because they combine with the wholesome Sarsaparilla, which operates by catenous excretions, and other substances which gently stimulate the secretions of the liver, glands and organs, render digestion easy, obviate costiveness, and remove regularly every impurity of the blood. They are unrivaled as a remedy for Scrofula, Dyspepsia, Constipation, Liver Complaint, Nervous Affections, Colic, Intermittent Fevers, and all diseases arising from impurity of the Blood or Costiveness.

Who Takes Them?

- The Old Man Takes them as a gentle stimulant and mild rejuvenator.
The Young Man Takes them to regulate his system, prevent disease, and stimulate to new life his overworked body.
The Young Woman Takes them to secure regularity in her habits; to tint her cheeks with the bloom of health; to give a sparkle to her eyes, and sweetness to her breath.
The Husband Takes them to promote vitality, give strength to the body, peace to the mind, and with his health, wealth and comfort to all his family.
The Wife Takes them to invigorate and strengthen her system, and as an aid to nature in regulating her periodical sickness.
Children Take them as a gentle, yet effective tonic.
The Dasheday Takes them as a mild, pure stimulant, containing none of the deleterious, essential and useful oils of forbidden drinks.
The Inebriate Takes them to give tone to his poisoned stomach and allay the fearful longings for strong drink with a stimulant that does not madden or destroy.
The Traveler Takes them to prevent sea sickness, and secure his health against change of climate.
Everybody Takes Them! PRO BONO PUBLICO! 2v15-6m

A Word to Readers in the Atlantic States.

Much complaint has reached us, through various sources, at the general lack of knowledge at the East, with regard to mining and other operations on this coast, and the frequent impositions practiced upon the public there, in consequence, by irresponsible persons passing off upon unsuspecting victims worthless mining stock, or persuading them, by false representations, to organize companies and advance moneys upon worthless ground, or ground which oftentimes has neither value or locality. If our friends at the East, who are still anxious to engage in the laudable venture of mining enterprise, would do so intelligently, let them subscribe for and carefully consult the only journal on the Pacific coast where every mining enterprise that is worth naming is, from time to time, noticed, as its merits may warrant. A mining enterprise on the Pacific coast, which is not referred to in this journal, in some way or other, as often as once in three or four months, is certainly one which people in the Atlantic States should beware of. Our advice to people at the East is never to venture small amounts in mining. If you must start small, let a number of such club together, so as to make the aggregate amount to be invested, such as may be worth your while to inquire into. Jan. 1, 1867.
